ABSTRACT

The SCALE (Standardized Computer Analyses for Licensing Evaluation) computer software system developed at Oak Ridge National Laboratory is widely used and accepted around the world for nuclear analyses. ORIGEN-ARP is a SCALE isotopic depletion and decay analysis sequence used to perform point-depletion calculations with the well-known ORIGEN-S code using problem-dependent cross sections. Problem-dependent cross-section libraries are generated using the ARP (Automatic Rapid Processing) module using an interpolation algorithm that operates on pre-generated libraries created for a range of fuel properties and operating conditions. Methods are provided in SCALE to generate these libraries using one-, two-, and three-dimensional transport codes. The interpolation of cross sections for uranium-based fuels may be performed for the variables burnup, enrichment, and water density. An option is also available to interpolate cross sections for mixed-oxide (MOX) fuels using the variables burnup, plutonium content, plutonium isotopic vector, and water moderator density.

This primer is designed to help a new user understand and use ORIGEN-ARP with the OrigenArp Windows graphical user interface in SCALE. It assumes that the user has a college education in a technical field. There is no assumption of familiarity with nuclear depletion codes in general or with SCALE/ORIGEN-ARP in particular. The primer is based on SCALE 6 but should be applicable to earlier or later versions of SCALE.

Information is included to help new users, along with several sample problems that walk the user through the different input forms and menus and illustrate the basic features. References to related documentation are provided.

The primer provides a starting point for the nuclear analyst who uses SCALE/ORIGEN-ARP. Complete descriptions are provided in the SCALE documentation. Although the primer is self-contained, it is intended as a companion volume to the SCALE documentation. (The SCALE Manual is provided on the SCALE installation DVD.)

1. INTRODUCTION

1.1 PURPOSE

ORIGEN-ARP is a calculational sequence in the SCALE code system to perform rapid and accurate point-depletion and decay calculations. The Automatic Rapid Processing (ARP) module interpolates pregenerated cross-section libraries to create problem-dependent cross sections for use with the ORIGEN code. Interpolation of cross-section libraries for uranium fuel systems is performed on the following variables: burnup, enrichment, and optionally moderator density. For mixed-oxide (MOX) fuels, additional interpolations are performed on the initial plutonium isotopic concentrations. The OrigenArp Windows graphical user interface (GUI) provides an easy-to-use input processor for the ORIGEN-ARP depletion analysis sequence that provides menus, toolbars, and forms that help a user set up a SCALE input file to execute ARP and ORIGEN. OrigenArp is coupled with the PlotOPUS Windows plotting program that plots calculated results from ORIGEN.

1.2 MANUAL ORGANIZATION

To make the primer easy to use, there is a standard set of notations that you need to know. The text of this primer is set in Times New Roman font. Information that you type into an input file (or provide to OrigenArp) is set in Courier font. Characters in the Courier font represent commands, keywords, or data that would be used as computer input. References to items displayed on the screen by OrigenArp are highlighted in **bold font**. Because the primer often references the SCALE Manual, these references will be set in square brackets, for example, [see SCALE Manual Section x].

This manual is divided into the following sections.

Introduction contains general information about the manual.

Getting Started provides the setup options and a simple example.

Toolbars lists the functions of the various toolbar buttons.

Menus lists all menu options.

UO₂ Express Form is used to generate detailed input based on a minimum amount of information for a UO₂ fuel depletion simulation.

MOX Express Form is used to generate detailed input based on a minimum amount of information for a MOX fuel depletion simulation.

Detail Forms are used to view, enter, or modify the OrigenArp detail input data.

Sample Problem 1: Express Form provides an example of how to use the “Express” form to generate ORIGEN-ARP detailed input quickly.

Sample Problem 2: Detail Forms provides a detailed example of how to generate ORIGEN-ARP input files and execute SCALE on the Windows PC.

Sample Problem 3: Decay Only Problem provides an example of how to calculate a radioactive decay problem.

Plotting Results provides instructions for plotting results using PlotOPUS.

Importing ORIGEN-ARP Input Files provides instructions on how to import existing ORIGEN-ARP input files to create OrigenArp detail data.

Required Data Sets describes data sets that are required in order to execute OrigenArp.

How to Add New Neutron and Gamma Energy Group Structures provides instructions on how to add new energy group structures to the OrigenArp menus for neutron and gamma spectra calculations.

Advanced Features provides information on shortcuts and features that are not documented elsewhere in this manual.

Troubleshooting provides helpful hints and suggestions on what to do when things go wrong.

2. GETTING STARTED

2.1 STARTING THE PROGRAM

Launch OrigenArp by double-clicking on the OrigenArp shortcut in the SCALE 6 folder on your Windows desktop. The initial screen display should look like Fig. 1.

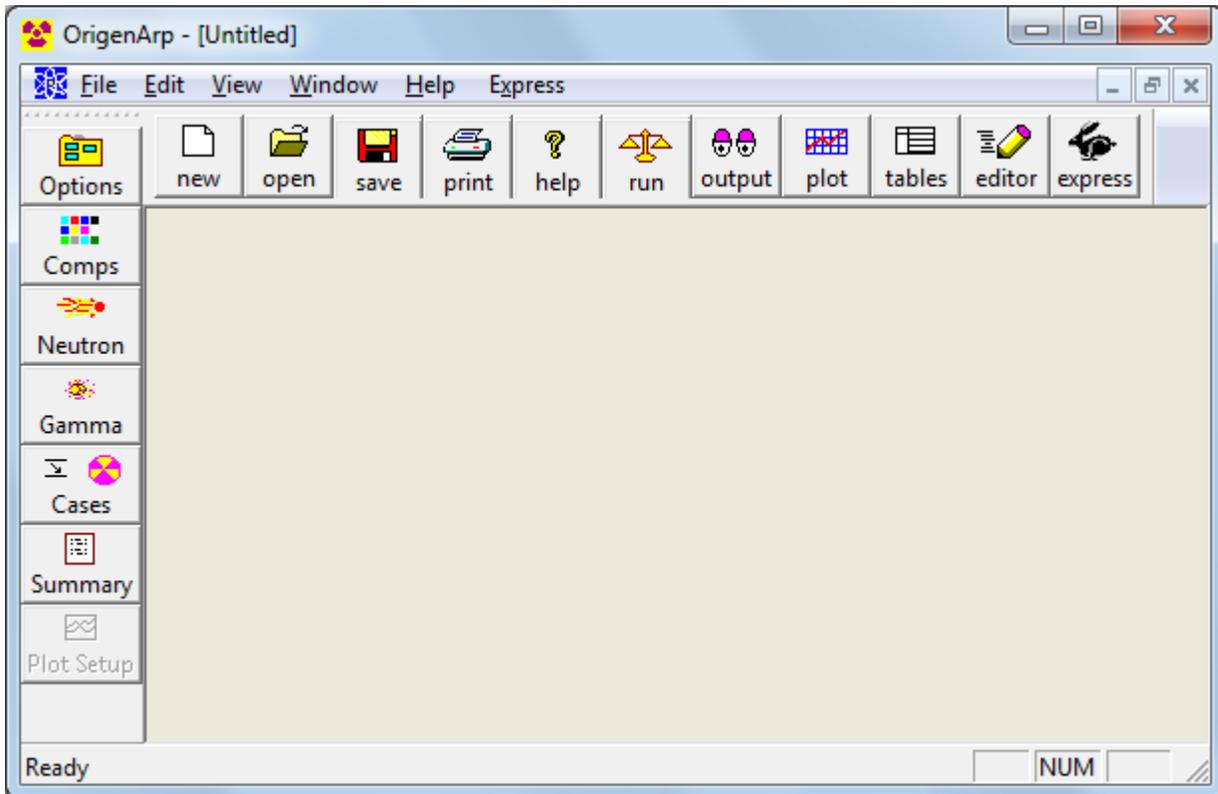

Fig. 1. Initial OrigenArp screen display

2.2 SETUP OPTIONS

Click the **Options** button on the left toolbar to access setup options. The **Default Settings** form (Fig. 2) allows you to override default settings for a few basic parameters. Note that the option to select Activation Mode is only available if OrigenArp finds activation libraries in its path. No activation libraries are supplied with SCALE. These must be generated and supplied by the user. This advanced feature is beyond the scope of this primer. The **Reset Defaults** button resets all setup options to the original installation settings.

Fig. 2. Default Settings form.

2.3 EDITOR SETUP

Click the **Editor Setup** button on the **Default Settings** form to open the **Editor Setup** form (Fig. 3) to specify your preferred text editor. The default editor is the Programmer's File Editor (PFE) that is distributed and installed with SCALE. The editor you select (e.g., PFE, EditPad, Wordpad) must allow the name of a file to be passed as an argument to the editor. When the user clicks the **Editor** button, the SCALE input file for the current job is opened and displayed in the specified editor. Similarly, when the user clicks the **Output** button, the corresponding SCALE output file is opened in the editor.

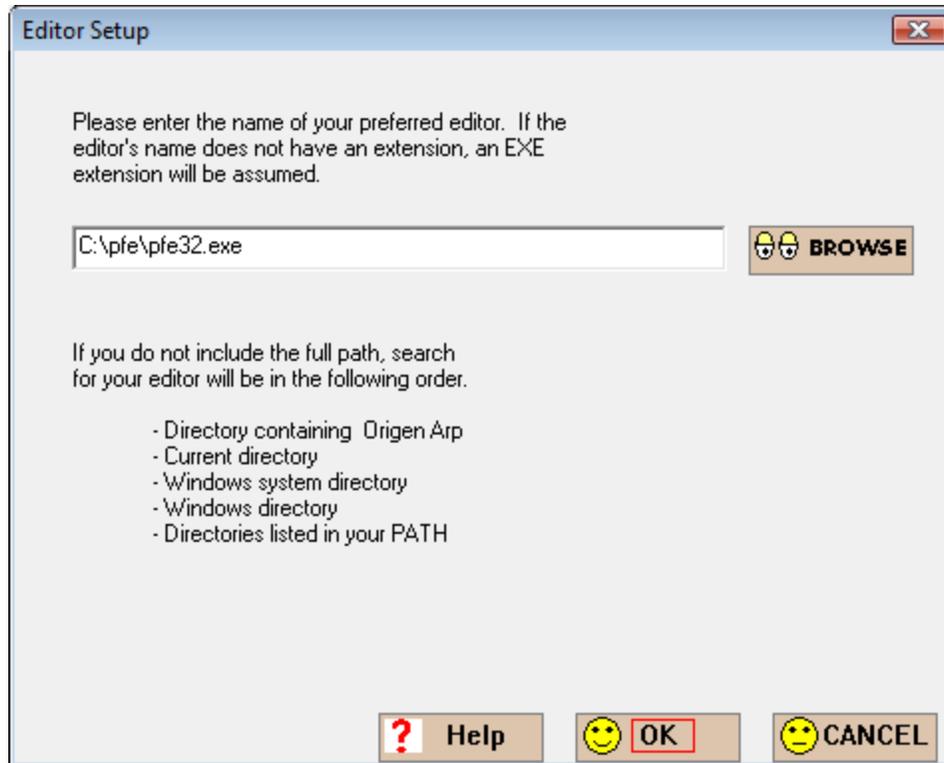

Fig. 3. Editor Setup form.

2.4 SAMPLE PROBLEMS

The OrigenArp\Examples folder under the SCALE installation directory (e.g., C:\scale6\OrigenArp\Examples) contains several sample problems. Files with an extension “.arp” are binary files that are readable by OrigenArp and represent an input case for an ORIGEN-ARP sequence calculation. We will step through a simple example input file named “Demonstration.arp.”

- Start OrigenArp by clicking on the shortcut in the SCALE6 folder on your desktop.
- Click on the **Open** button on the top toolbar.
- Navigate to the \scale6\OrigenArp\Examples folder.
- Click on the file named “Demonstration.arp.”

Once the file is opened, click on the **Summary** button on the left toolbar to display a summary of the input in the main window, as shown in Fig. 4.

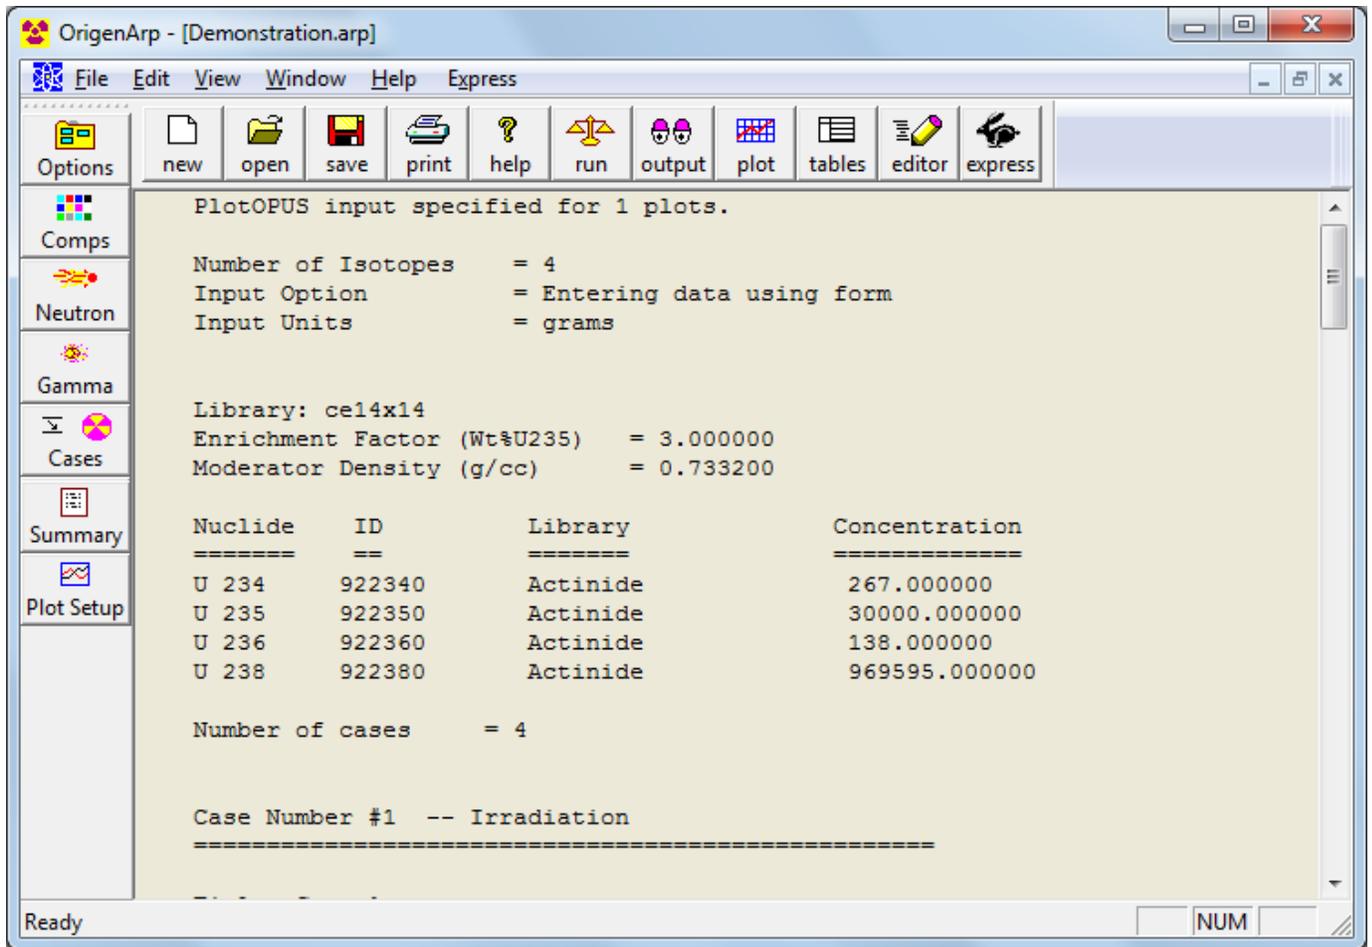

Fig. 4. Summary display of Demonstration.arp example.

Press the **Run** button to create the SCALE input file and execute the problem. A DOS window will automatically open and display the progress of the calculation in SCALE, as shown in Fig. 5.

```
Administrator: C:\Windows\system32\cmd.exe
*****
*   scale6 called in batch mode.
*****

          SCALE 6 Job Information
          -----
Job started on LAP0075142 on Fri 07/10/2009 17:12:59.29
SCALE version   : scale6 on drive c:
Working directory: C:\scale6\tmp_30751
Input file name  : Demonstration.inp
Output file name : Demonstration.out
Output directory : C:\scale6\OrigenArp\Examples

*****
Now executing arp
Now executing origen
Now executing opus
    1 file(s) copied.

scale6 job Demonstration.inp is finished.
Output is stored in Demonstration.out.

C:\scale6\OrigenArp\Examples>
```

Fig. 5. DOS window for execution of SCALE.

When the calculation is complete, close the DOS window by clicking on the “X” in the upper right corner of the window. Then click on the **Output** button in the OrigenArp top toolbar to open the SCALE output file in the text editor that you previously specified in **Editor Setup**. The output file for this case is displayed in the default PFE editor in Fig. 6.

The image shows a screenshot of a 'Programmer's File Editor' window. The title bar reads 'Programmer's File Editor - [Demonstration.out]'. The menu bar includes 'File', 'Edit', 'Options', 'Template', 'Execute', 'Macro', 'Window', and 'Help'. The toolbar contains various icons for file operations like opening, saving, printing, and editing. The main text area displays the following output:

```
*****

Fig. 6. SCALE output file.

3. TOOLBARS

OrigenArp displays two toolbars at any given time: the top toolbar and the left toolbar. In addition to the main toolbars, selected input forms contain specific toolbars with functions relevant to the form. If OrigenArp is displaying the “Origen Express” form, the top toolbar displays buttons relevant to the Express data. If OrigenArp is displaying the “Detail” input forms, the top toolbar displays buttons to allow editing, executing, plotting, and viewing of the Detail input data. The **Express/Detail** toolbar button allows you to switch between Express mode and Detail mode.

3.1 TOP TOOLBAR

The top toolbar can be docked or moved to any location on the screen. At startup the toolbar is docked.

New. This button initializes all forms to create a new OrigenArp problem. If there are existing data, the user is given the option to save the data or cancel before proceeding.

Open. This button is the same as the **Open** option under the **File** menu. The active folder will be opened, and a file dialog box will allow the user to select the appropriate binary .arp input file to display.

Save. This button is the same as the **Save** option under the **File** menu. If the file was previously saved, OrigenArp will save the data to the current path and filename. If this is a new problem, a file dialog will be presented so that the user can specify the path and filename. Both a SCALE input text file with an .inp extension and a binary .arp file are saved.

Print. This option prints the contents of the **Summary View** to the default printer. It is the same as the **Print** option under the **File** menu.

Help. This is the context-sensitive **Help** button. The OrigenArp help files are displayed, with help information for the active form. Context-sensitive help can also be displayed by pressing the **F1** key.

Run. The **Run** button saves the SCALE input text file with an .inp extension and a binary .arp file, opens a DOS window, and proceeds to execute the problem in SCALE as shown in Fig. 5. Once the job is completed, you should close the DOS execution window. You cannot start another calculation in SCALE until the previous DOS window has been closed.

Output. The **Output** button displays the output from SCALE using the text editor specified in Editor Setup.

Plot. This button calls the interactive PlotOPUS plotting program to display plots that were generated during the SCALE calculation.

Tables. The **Tables** button opens the text editor to display the tables of the plot data generated during the SCALE calculation.

Editor. The **Editor** button allows you to view and/or edit the SCALE input file (.inp) using the text editor specified in Editor Setup.

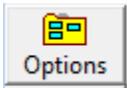

Express/Detail. This button changes the input form from “Detail” to “Express” if the button text is “Express” or from “Express” to “Detail” if the button text is “Detail.”

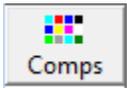

3.2 LEFT TOOLBAR – DETAIL MODE

The left toolbar buttons may be used to view or modify the data in any of the existing forms.

In Detail mode, the **Left** toolbar contains seven buttons.

Options. The **Options** dialog includes default setting for several items. There is a **Reset Defaults** button that will reset all setup options to the original installation settings.

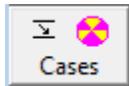

Comps. The **Compositions** form is activated, showing the last page of composition input. The composition input may span several pages.

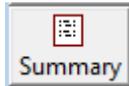

Neutron. The Neutron Groups form displays the energy group structure used to calculate neutron source terms.

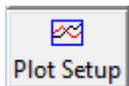

Gamma. The **Gamma Groups** form displays the energy group structure used to calculate gamma source terms.

Cases. The **Case Data** dialog allows you to create, edit, insert, or delete irradiation and decay cases.

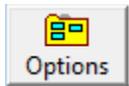

Summary. The Summary screen displays a summary of the input data.

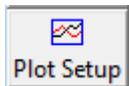

Plot Setup. This option allows the user to specify information needed to create plots using the OPUS post-processing program for ORIGEN.

3.3 LEFT TOOLBAR – EXPRESS MODE

In Express mode, the **Left** toolbar contains two buttons.

Options. The **Options** dialog includes default settings for several items. There is a **Reset Defaults** button that will reset all setup options to the original installation settings.

Plot Setup. This option allows the user to specify information needed to create plots using the OPUS post-processing program for ORIGEN.

4. MENUS

4.1 FILE MENU

The **File** menu contains the following selections:

- **New** – clears memory to start a new problem
- **Open** – opens an existing input file
- **Close** – closes the active file; user is given option to save unsaved data
- **Save** – saves the active file, using the present filename and path
- **Save As** – saves the active file with new filename or path
- **Import** – imports existing ORIGEN-ARP text input files
- **Print** – prints the **Summary View** to the default printer
- **Print Preview** – previews the **Summary View** before printing
- **Print Setup** – starts the **Printer Setup** dialog
- **Execute SCALE** – saves input file and executes SCALE in new temporary working directory
- **Execute SCALE w/out saving** – does not save input file before executing SCALE; this option allows user to modify input file in text editor prior to running SCALE
- **Execute SCALE6.BAT (in TMPDIR)** – saves input file and executes SCALE in default TMPDIR; this option allows user to access input or output files in temporary working directory before or after running SCALE
- **Exit** – terminates OrigenArp; user is given option to save unsaved data

4.2 EDIT MENU

The **Edit** menu has the following selections:

- **Setup Options** – opens **Default Settings** form; same as **Options** button
- **Setup Editor** – opens **Editor Setup** form to specify text editor
- **Edit File** – opens input file with text editor; same as **Editor** button
- **Setup OPUS Cases** – setup input for generating plot data; same as **Plot Setup** button
- **Edit Enrichment Fractions** – opens **Enrichment Fractions** form to specify fuel enrichment factors
- **Undo** – reverses the last change displayed in the active edit field
- **Cut** – cuts highlighted item in active edit field to clipboard
- **Copy** – copies highlighted item in active edit field to clipboard
- **Paste** – pastes clipboard item into active edit field

4.3 VIEW MENU

The **View** menu contains the following selections:

- **Toolbar** – toggles display of left toolbar
- **Status Bar** – toggles display of status bar at bottom of main window
- **Set Font** – sets the font for the Summary View menu

4.4 WINDOW MENU

The **Window** menu contains the following selections:

- **Cascade** – presents all form windows in a cascaded order
- **Tile** – presents all form windows in a tiled format

4.5 HELP MENU

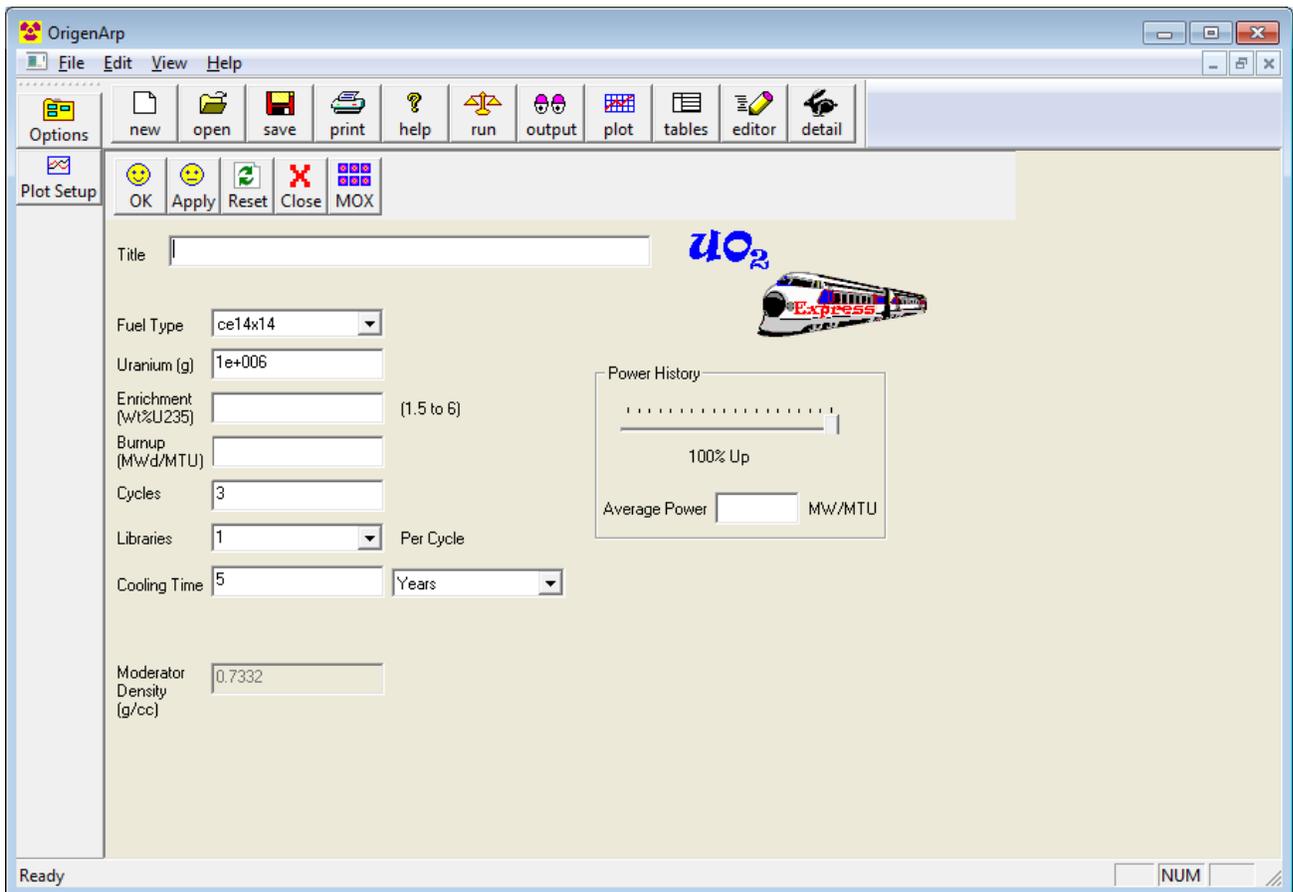

The **Help** menu contains the following selections:

- **OrigenArp Help Topics** – starts the OrigenArp interactive help system
- **About OrigenArp** – displays the OrigenArp version number and creation date

5. UO₂ EXPRESS FORM

The Express mode is designed to perform an OrigenArp calculation using a minimum amount of user input. All data are input on one form – the Origen Express form. Express forms are available for both UO₂ and MOX fuel types. Calculations can be executed directly from the Express mode. After entering data in the Express form, the user has the option to toggle to Detail mode and access the Detail forms, allowing the user to modify any information that was generated automatically by the Express mode. However, once the user switches to the Detail mode, the user cannot toggle back to the Express form without losing information because not all options available in the Detail mode are available in the Express mode.

The OrigenArp **UO₂ Express** form (Fig. 7) is used to quickly generate detailed input based on a minimum amount of information for UO₂ fuel including fuel type, total uranium, enrichment, burnup, and power history. Click on the **Express** button to switch from Detail to Express mode. Note that the **UO₂ Express** form is not available when OrigenArp is in Activation mode.

The screenshot shows the OrigenArp software interface with the UO₂ Express form open. The window title is "OrigenArp" and it has a menu bar with "File", "Edit", "View", and "Help". The toolbar includes icons for "Options", "new", "open", "save", "print", "help", "run", "output", "plot", "tables", "editor", and "detail". Below the toolbar is a "Plot Setup" section with buttons for "OK", "Apply", "Reset", "Close", and "MOX". The main form area contains the following fields and controls:

- Title:
- Fuel Type:
- Uranium (g):
- Enrichment (wt%U235): (1.5 to 6)
- Burnup (MWd/MTU):
- Cycles:
- Libraries: Per Cycle
- Cooling Time:
- Moderator Density (g/cc):
- Power History: A graph showing a power history curve with a peak at "100% Up" and an "Average Power" MW/MTU.

The status bar at the bottom left shows "Ready" and the bottom right shows "NUM".

Fig. 7. UO₂ Express form.

5.1 FUEL TYPE

The fuel assembly configuration types available to OrigenArp are specified in a file named ARPDATA.TXT, which is installed as part of the SCALE system (see Section 13.1). Users may add other fuel assembly types to ARPDATA.TXT for libraries that they create. Techniques for creating ARP libraries are described in the [SCALE Manual Sect. D1.A.2].

5.2 URANIUM

Uranium represents the total initial concentration of uranium in grams for generating the U-234, U-235, U-236, and U-238 concentrations when the concentrations are generated using the Enrichment Fractions Algorithm. The default is 1.00E+6 (i.e., 1 MTU). It is possible for the user to modify the concentrations or insert other isotopes of uranium using the **Composition Data** form.

5.3 ENRICHMENT

The values input for the wt% U-235 and the **Uranium** concentration are used by the Enrichment Fractions Algorithm to determine initial concentrations of U-234, U-235, U-236, and U-238. The range of acceptable values for enrichment is specified in ARPDATA.TXT. Though OrigenArp checks the value entered for enrichment to determine if it falls within the allowed range, the user may choose to ignore the warning and generate SCALE ORIGEN-ARP input with enrichment outside the allowed range. However, values that are outside the range may cause ORIGEN-ARP to fail.

5.4 BURNUP

The value entered for **Burnup** represents the total burnup of the fuel over all cycles. The burnup value will be divided by the number of cycles to determine the burnup per cycle. The value is entered in MWd/MTU. The allowed range for burnup is determined by the maximum burnup value in ARPDATA.TXT for the selected fuel type.

5.5 CYCLES

The user specifies the number of fuel cycles (irradiation case for power operation followed by decay case for shutdown/refueling) to represent the irradiation history. OrigenArp will generate as many irradiation/decay cases as needed to represent the problem. An updated cross-section library is interpolated by ARP for each cycle based on the mid-cycle burnup.

5.6 LIBRARIES PER CYCLE

The user may enter the minimum number of libraries to generate per cycle. There will be a new irradiation case for each library. ARP will produce a burnup-dependent library based on the midpoint burnup of each irradiation case. The cross sections remain constant throughout the irradiation case. Increasing the number of libraries increases the accuracy of the cross-section data because the burnup range where cross sections remain constant decreases.

OrigenArp limits irradiation cases to a maximum of 1000 days. If the 1000-day limitation requires that a cycle be divided into additional irradiation cases, then the number of libraries per cycle actually used will be greater than that requested by the user.

5.7 COOLING TIME

Cooling time is the final decay time after fuel is discharged from the reactor. When using the Express form, the final case will be a decay case.

5.8 MODERATOR DENSITY

Moderator density (g/cm^3) must be within the range of densities specified in ARPDATA.TXT at which the ARP basic libraries for the selected fuel type were generated. For libraries that do not have variable moderator density (e.g., the libraries were generated using average hot full power values), this input field is not used, and the value in the field represents the value associated with the library.

5.9 POWER HISTORY

Power history specifies the average specific power level in units of MW/MTU. The ratio of irradiation time (uptime) to the total time (uptime + downtime between cycles) that the fuel resides in the reactor can be set using the slide bar (Fig. 8). If this value is set less than 100%, decay cases are automatically included between each cycle to account for the downtime, such as reactor refueling.

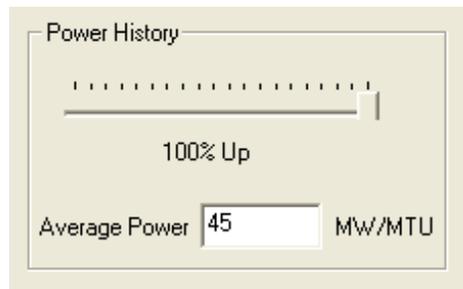

Fig. 8. Power history input.

5.10 OPEN AND SAVE BUTTONS

OrigenArp Express data can be saved in a binary format .uo2 file by pressing the **Save** button. Saved express data can later be selected to initialize the **UO2 Express** form using the **Open** button. Pressing the **OK** or **Detail** button converts the data to detailed data that can be edited using the **Detail** forms that have been discussed previously. Once the data are converted to detailed format, the data can no longer be displayed in **Express** mode.

6. MOX EXPRESS FORM

The **MOX Express** form (Fig. 9) is used to quickly generate detailed input for mixed-oxide (MOX) fuel assemblies based on a minimum amount of information including fuel type, uranium and plutonium distribution, enrichment, burnup, and power history. Once the input is generated using the **Express** form, the user may elect to view and modify the data using the **Detail** forms or to execute SCALE immediately from within the **Express** form.

Pressing the **MOX** button on the **UO2 Express** form (Fig. 7) switches to the **MOX Express** form. Note that only the input fields on this form that differ from the **UO2 Express** form are discussed below.

The screenshot shows the MOX Express form in the OrigenArp application. The form is titled "MOX Fuel" and contains the following fields and controls:

- Title:** MOX Fuel
- Fuel Type:** mox14x14
- Heavy Metal (g):** 1e+006 (Pu + U + Am)
- % (Pu + Am) / Heavy Metal:** [Empty field]
- % Am / (Pu + Am):** [Empty field]
- Burnup (MWd/MTM):** [Empty field]
- Cycles:** 3
- Libraries:** 1 Per Cycle
- Cooling Time:** 5 Years
- Moderator Density (g/cc):** 0.745
- Power History:** A slider set to 100% Up, with Average Power 0 MW/MTU.
- Reference Date:** 2/16/2010
- Loading Date:** 2/16/2010
- Heavy Metal Distribution:** A table with columns Name, Isotope, and Total.

Name	Isotope	Total
Pu	238	
	239	
	240	
	241	
	242	
U	234	
	235	
	236	
	238	
	238	

Fig. 9. MOX Express form.

6.1 HEAVY METAL

Heavy Metal represents the total initial concentration in grams of Pu-238, Pu-239, Pu-240, Pu-241, Pu-242, U-234, U-235, U-236, U-238, and Am-241.

6.2 PERCENT PU AND AM IN HEAVY METAL

The $(\%Pu + Am) / \text{Heavy Metal}$ represents the percentage of all Pu isotopes and Am-241 in the heavy metal. The $\%Am / (Pu + Am)$ represents the percentage of Am-241 in Pu + Am. These values are used to characterize the fuel isotopic distribution.

6.3 REFERENCE AND LOADING DATES

The **Reference Date** and **Loading Date** input fields (Fig. 10) have a built-in calendar to assist in specifying the data.

Reference date is the date for which the fuel isotopic compositions were specified prior to irradiation.

Loading date is the date when the first irradiation case begins. Any difference between the reference and loading dates is used to correct the input isotopic distributions for the decay of Pu-241 to Am-241.

	Sun	Mon	Tue	Wed	Thu	Fri	Sat
Heavy	28	29	30	1	2	3	4
	5	6	7	8	9	10	11
	12	13	14	15	16	17	18
	19	20	21	22	23	24	25
Pu	26	27	28	29	30	31	1
	2	3	4	5	6	7	8
Today: 4/19/2006							
	241	5310					
	242	2348.28					
U	234	18.7978					
	235	2227.54					
	236	9.3989					
	238	937634					
Am	241	634.16					

Fig. 10. Reference and loading dates input.

6.4 HEAVY METAL DISTRIBUTION

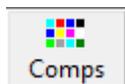

The **Heavy Metal Distribution** table allows the user to enter either the weight percent or the mass (grams) of the specified isotopes. If gram values are entered, the first three fields beneath **Fuel Type** cannot be edited. These fields are automatically updated based on the grams entered for each isotope.

If weight percent values are entered, the sum of the Pu isotopes must be 100, and the sum of the U isotopes must be 100. The amount of Pu-241 must be greater than zero. OrigenArp will check that the $\%Pu/\text{Heavy Metal}$ and the weight percent of Pu-239 are within the library range specified in ARPDATA.TXT for the selected **Fuel Type**.

7. DETAIL FORMS

The OrigenArp detail forms are used to input or modify detailed input data. Ultimately, it is the detailed input that is used to generate the SCALE input file to execute ARP and ORIGEN. The detailed input can be created directly by using these forms, by importing previously created input files, or by using the OrigenArp Express mode.

7.1 COMPOSITIONS

Nuclide compositions are required input for ORIGEN to define the initial configuration of the system being analyzed. Radio buttons on the top left of the **Compositions** form (Fig. 11) allow the user to select **Enter composition data** or **Restart from existing data file**. Depending on the option selected, the screen will display those data items that are required.

The screenshot shows the 'Composition Data' window for 'Demonstration.arp'. It features a toolbar with buttons for 'Ok', 'Apply', 'Reset', 'Help', 'Previous', 'Next', 'Enrich', 'Fuel Dist', 'Del Row', and 'Cancel'. Below the toolbar, there are radio buttons for 'Enter composition data' (selected) and 'Restart from existing data file'. A 'Units' dropdown is set to 'Grams'. The main area is titled 'Compositions' and 'Irradiation Mode Page 1'. On the left, there are input fields for 'Fuel Type' (ce14x14), 'Moderator Density' (0.733200 g/cc), 'Uranium' (1000000 g), and 'Enrichment (wt%U235)' (3). On the right, there is a table with columns for 'Element', 'Isotope', 'Library', and 'Concentration'.

	Element	Isotope	Library	Concentration
1	U	234	Actinide	267
2	U	235	Actinide	30000
3	U	236	Actinide	138
4	U	238	Actinide	969595
5				

Fig. 11. Compositions form.

7.1.1 Enter Composition Data

If **Enter composition data** is selected, the **Units** field gives the user a choice of input units (grams, gram-atoms, or curies). The user selects each nuclide by **Element** from an alphabetical menu and then selects the **Isotope** (e.g., “U” and “235” for U-235 and “Xe” and “135m” for Xe-135 metastable). The “Natural” option provides a natural distribution of the element instead of a specific isotope. This option is available for most light elements.

The user then selects the **Library**. The choices are “light element,” “actinide,” or “fission product,” and only valid choices for the specified nuclide are displayed. The selection of the library should be based on the origin of the nuclide and the desired grouping for output edits in ORIGEN. If the nuclide appears in only one library, the program automatically fills the field with the appropriate library.

The last field in each row is the **Concentration**. The concentration is input in the units selected. The concentration that is input for each nuclide determines the “basis” of the problem (e.g., fuel assembly or metric ton of uranium). Note that the problem basis is very important because it determines the values of other input parameters (e.g., power for irradiation cases) and the units of output parameters (e.g., nuclide concentrations or source terms per basis unit).

Fuel Type is selected from the list of fuel assembly types in the ARPDATA.TXT file, which is required by OrigenArp and is located in the SCALE data directory.

The allowed range of input values for **Moderator Density** for each fuel type is obtained from ARPDATA.TXT. If cross-section data were generated at multiple moderator densities, ARP interpolates the cross sections versus moderator density. If cross-section data were generated for only one moderator density, the default value for this field cannot be changed.

The **Uranium** concentration in grams is automatically calculated and displayed in this field. This value provides the user with confirmation of the basis for the problem (e.g., 1 g U, 1000000 g U = 1 MTU, etc.). Additional data written to the ARP input file include the average power history in MW/MTU for each irradiation case. The power history entered in Irradiation Case data is converted from MW/basis unit to MW/MTU using the MTU per basis unit (or metric ton heavy metal for mixed-oxide fuel) in the Compositions input. Note that the **Uranium** field is not calculated or displayed when the input units are curies. Curies are allowed as input units only for decay-only jobs.

Enrichment is automatically calculated from the composition data if input units are grams or gram-atoms. This value is used by ARP to interpolate the cross sections versus enrichment. For MOX fuel types, the label is **Heavy Metals**.

7.1.2 How to Delete a Nuclide from the Composition Form

To delete a nuclide, highlight the nuclide to delete, then press the **Delete** key or use the **Delete** button on the toolbar. The entire row will be cleared.

7.1.3 Automatic Calculation of Uranium Isotopic Concentrations

An option is available to automatically generate uranium isotopic concentrations based on the initial enrichment using the **Enrich** button. This button displays a form (Fig. 12) for the user to enter the initial U-235 enrichment and total uranium mass in grams. The allowed range of enrichments associated with the selected fuel type is displayed to the right of the enrichment field. Clicking **OK** fills the **Composition** form with the defined uranium isotopic data. Note that initial amounts of U-234 and U-236 are defined by the default enrichment fractions specified in the **Enrichment Fractions** form, which can be accessed by pressing Alt+E.

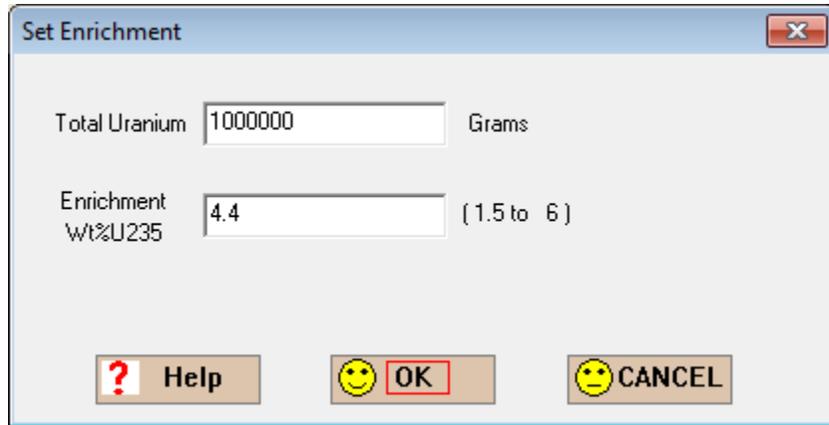

Fig. 12. Set Enrichment form.

Alternatively, the user may define initial uranium isotopic concentrations using the **Fuel Dist** button, which opens the **Fuel Distribution** form (Fig. 13). This option performs a function similar to the **Enrich** button, except that the default enrichment fractions are not used, and any distribution may be specified. The code can automatically calculate the **Weight Percent** value for the last isotope selected such that the total will yield 100 %. To activate, double-click on the first column (**Name**) in the row of that isotope. The “Fill to 100%” label then appears. Click on the label to automatically adjust that isotope’s weight percent.

Fuel Distribution X

Total Uranium g

Name	Isotope	Weight Percent
U	234	
	235	4.4
	236	
	238	95.6

Note: After entering some data, clicking in column one will activate the "fill" button for the selected row.

Fig. 13. Fuel Distribution form.

7.1.4 Restarting from an Existing Data File

To have ORIGEN restart using nuclide compositions read from a data set written by a previous ORIGEN job, the user must select the **Restart from existing data file** radio button at the top of the Compositions form (Fig. 14). All nuclide fields are removed. **Note:** any composition data previously entered on the form will be lost.

The user is required to enter the **unit number**, **position**, and name of the **restart file**.

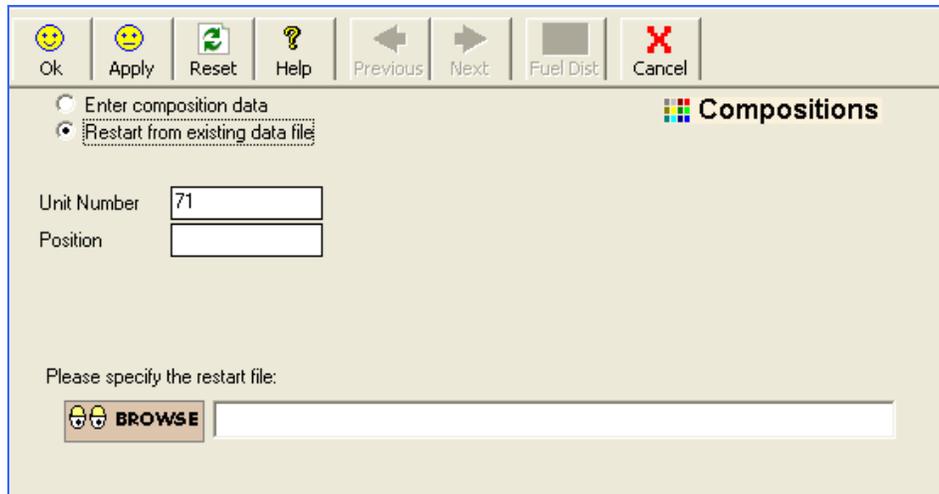

Fig. 14. Restart from existing data file option.

The **unit number** is the input/output (I/O) unit number of the data set. The unit number defaults to 71 as this is the unit where the ORIGEN restart file is typically written and read by ORIGEN.

The **position** is the position of the concentrations in the file. ORIGEN restart files can contain data from numerous time steps in calculation. Note that ORIGEN prints the position in the file when it writes the data. If the user inserts either position number 0 or 1, ORIGEN reads from the first position in the file.

Click the **Browse** button to select the restart file. When the open file dialog box opens, it will initially display only files with .f71 extensions. To find a file with a different extension, click on “Files of Type” dropdown box and select “All Files (*.*)”.

OrigenArp will expect a name of the form “filename.f71,” where the filename is the prefix from the active OrigenArp problem and the “71” is the unit number specified by the user. During execution of SCALE, the restart file will be copied to a file named “ft71f001” in the SCALE temporary directory. If the user selects a restart unit number other than “71,” the file created will be “ft###f001,” where “##” is the unit number.

IMPORTANT NOTE: If the user is reading from a position prior to the last one in the file, the data that follow may be overwritten if new restart data are saved. If the user reads restart data and saves results in the same job, ORIGEN begins writing data in the file position immediately following the one from which it read. It does not search for the end of file.

7.2 NEUTRON GROUPS

This option specifies the energy group structure for neutron source term spectra edits. These edits are printed for individually selected time steps in the decay cases for which source terms are desired. This form (Fig. 15) is required to obtain neutron source term output. The first field on the screen provides a multiple-choice list of energy group structures corresponding to commonly used neutron cross-section

libraries. Selecting “Other” allows you to input a user-defined group structure. If you are running only irradiation cases or do not want these edits, select “None.”

Group Structure: 44GrpENDF5 Number of Groups: 44 Neutron Energy

Maximum Neutron Energy (eV) by Group

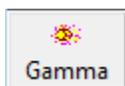

1	2.000000e+007	2	8.187300e+006	3	6.434000e+006	4	4.800000e+006	5	3.000000e+006
6	2.479000e+006	7	2.354000e+006	8	1.850000e+006	9	1.400000e+006	10	9.000000e+005
11	4.000000e+005	12	1.000000e+005	13	2.500000e+004	14	1.700000e+004	15	3.000000e+003
16	5.500000e+002	17	1.000000e+002	18	3.000000e+001	19	1.000000e+001	20	8.100000e+000
21	6.000000e+000	22	4.750000e+000	23	3.000000e+000	24	1.770000e+000	25	1.000000e+000
26	6.250000e-001	27	4.000000e-001	28	3.750000e-001	29	3.500000e-001	30	3.250000e-001
31	2.750000e-001	32	2.500000e-001	33	2.250000e-001	34	2.000000e-001	35	1.500000e-001
36	1.000000e-001	37	7.000000e-002	38	5.000000e-002	39	4.000000e-002	40	3.000000e-002
41	2.530000e-002	42	1.000000e-002	43	7.500000e-003	44	3.000000e-003	45	1.000000e-005

Fig. 15. Neutron groups form.

You can add a new energy group structure to the list by modifying the files OR_ARP_GroupLibOptions.dat and OR_ARP_NeutronGroups.dat (for neutron groups) or OR_ARP_GammaGroups.dat (for gamma groups). For more information on this topic, refer to “How to Add New Neutron and Gamma Energy Group Structures” in this primer.

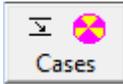

If you select one of the standard group structures or “None,” no other input is required. If “Other” is selected, then you must specify the number of energy groups and click **Apply** or **OK**. OrigenArp displays a set of edit boxes equal to the number of groups plus one. You must input the maximum-energy cutoff in electron volts (eV) for each group, beginning with group 1 (the highest-energy group). The final edit box contains the minimum-energy cutoff for the last energy group. OrigenArp verifies that the energies are entered in order from highest to lowest.

7.3 GAMMA GROUPS

Similar to the Neutron Groups form, this option specifies the energy group structure for gamma source term spectra edits. Please refer to the previous section on “Neutron Groups” for details on how to use this form.

7.4 CASE DATA

The **Case Data** dialog allows you to create a new case or edit an existing case (Fig. 16).

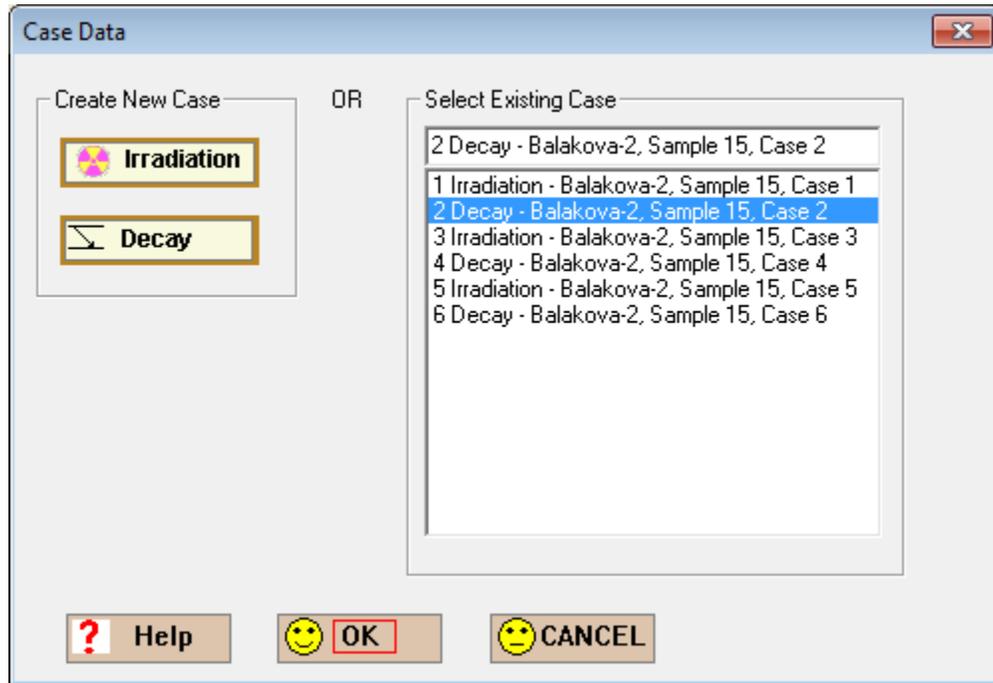

Fig. 16. Case data form.

To **create new case**, click the button for the case type (**Irradiation** or **Decay**) that you wish to create. Depending upon which button you click, either the **Irradiation Case** form or the **Decay Case** form is displayed. The new case is added after the last specified case. If there is no previous case, the new case is the first case.

To **select existing case**, highlight the case that you wish to edit and click the **OK** button. The appropriate form for that case is displayed.

Each case is limited to ten time steps, because this is the maximum number that fit across a page of the ORIGIN output. Each case has a **Title** and a **Basis**. The **Basis** is a subtitle in the ORIGIN output that describes the basis for the calculations performed as determined by the concentrations input (e.g., a fuel assembly or 1 MTU). The order in which cases are entered determines the order in which they appear in the ORIGIN input file and is reflected by the case number that is displayed in OrigenArp.

7.5 IRRADIATION CASE

Each irradiation case consists of a series of time steps where the fuel is irradiated. The **power** level (MW/basis unit) and the **cumulative time** from the case **beginning time** are input for each time step on

the **Irradiation Case** form (Fig. 17). The beginning time for the first case is zero. The beginning time for subsequent cases defaults to the ending time of the previous irradiation case unless the **Start ALL Irradiation Cases at Time Zero** box is checked for the first case.

The **Options** button displays a dialog that allows you to specify output options. The **Insert** and **Delete** buttons allow you to insert or delete a case. A case is inserted immediately before the present case. The **Delete** button deletes the current case. The **Fill** button is used to quickly generate irradiation input data at a specified power level for a specified amount of time, as explained in the next section.

IMPORTANT NOTE: The power must be consistent with the basis for the calculation (e.g., fuel assembly, MTU) in order for the calculated results to be correct.

Power(MW/BASIS)	Cumulative Time	Save Results
38	100	<input type="checkbox"/>
40	175	<input type="checkbox"/>
40	250	<input type="checkbox"/>
35	300	<input type="checkbox"/>
37	350	<input type="checkbox"/>
0	399	<input type="checkbox"/>
		<input type="checkbox"/>

Fig. 17. Irradiation case form.

The power and time input values are used to calculate burnup for each case. The burnup values are input to the ARP module that produces problem-dependent ORIGEN cross-section libraries by interpolating on enrichment, burnup, and moderator density in the case of UO₂ fuel.

Typically each irradiation case represents an operating cycle for a reactor. The maximum time increment for each time step in an irradiation case is 100 days with a minimum of 3 time steps per case. If the cycle history requires more than 10 time steps, the cycle history may span multiple irradiation cases. To specify downtime during an irradiation case, input zero for the power. For downtime at the end of a cycle or that exceeds 100 days, a decay case should be used.

OrigenArp checks that the cumulative time for each step is greater than that for the previous step. If a time step increment exceeds 100 days or the number of time steps is less than 3, OrigenArp prints a warning message. You can insert additional time steps or allow OrigenArp to insert additional time steps. If you want to use a constant power level for the entire case, you may enter the power and final time in the first row of the power time/time data, and use the **Fill Form** option to generate intermediate time steps for the total time specified.

Once additional time steps are inserted, you must again enter **Apply** or **OK** to cause the changes to take effect. You can modify the time steps generated by OrigenArp by simply editing the fields. OrigenArp checks the data whenever the form is validated (i.e., when you select **OK**, **Apply**, **Previous**, or **Next**).

The option to write restart data for a time step is set by clicking the **Save Results** check box for the desired time step. Results may be saved for any or all time steps. Only results from saved time steps are available to plot.

7.6 FILL FORM OPTION FOR IRRADIATION CASES

Fill. The **Fill** button allows you to quickly generate irradiation input time steps at a constant power level for the entire case. To use this option, insert a power level and total time for the case in the first row of the power/time table and then click the **Fill** button. OrigenArp will generate time steps at the specified power level using as many cases as needed such that the increment for each time step is no more than 100 days.

7.7 OPTIONS FOR IRRADIATION CASES

Options. The **Irradiation Output Options** form is accessed by pressing the **Options** button on the **Irradiation Case** form (Fig. 18).

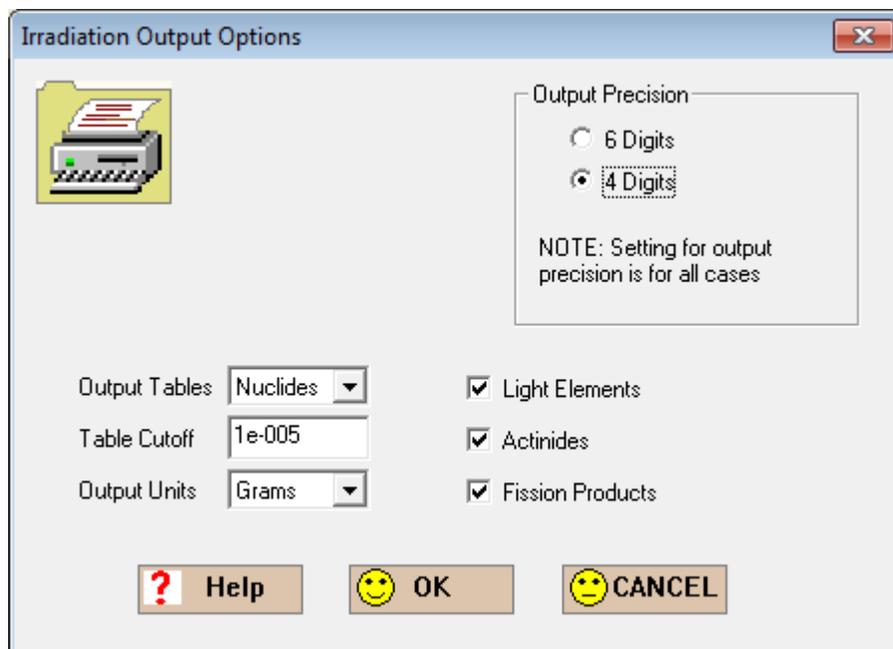

A screenshot of the 'Irradiation Output Options' dialog box. The dialog has a title bar with the text 'Irradiation Output Options' and a close button (X). On the left side, there is a folder icon containing a printer icon. On the right side, there is a section titled 'Output Precision' with two radio buttons: '6 Digits' (unselected) and '4 Digits' (selected). Below this is a note: 'NOTE: Setting for output precision is for all cases'. In the center, there are three rows of controls: 'Output Tables' with a dropdown menu set to 'Nuclides', 'Table Cutoff' with a text box containing '1e-005', and 'Output Units' with a dropdown menu set to 'Grams'. To the right of these are three checked checkboxes: 'Light Elements', 'Actinides', and 'Fission Products'. At the bottom, there are three buttons: 'Help' (with a question mark icon), 'OK' (with a smiley face icon), and 'CANCEL' (with a frowny face icon).

Fig. 18. Irradiation output options form.

This form controls the output options for the ORIGEN irradiation calculations only. When generating additional irradiation cases, the options are copied from the previous irradiation case. Output Tables may

be output for **Nuclides** (i.e., individual isotopes), **Elements**, **Both** nuclides and elements, or **None** to turn off irradiation case output. Separate output tables are generated for **Light Elements**, **Actinides**, and **Fission Products**. The **Table Cutoff** value specifies that any nuclide or element whose fractional contribution to the total is less than the cutoff will be omitted from the output. The **Output Units** may be **Grams** or **Gram-Atoms**.

7.8 DECAy CASE

A decay case consists of a series of time steps in which the compositions undergo radioactive decay and are specified on the **Decay Case** form (Fig. 19). The **beginning time** defaults to zero unless the previous case is also a decay case. If so, the beginning time for the current decay case is the ending time from the previous case. OrigenArp checks that the **cumulative time** for each time step is greater than that for the previous step. The recommended maximum initial time step is 100 days, or 0.3 years, and the cumulative time for subsequent steps should not exceed 3.3 times the cumulative time for the previous time step. Because the nuclides decay exponentially, this factor ensures accurate results. This rule is commonly known as the “Rule of 3’s.” If the time step increments violate the Rule of 3’s, OrigenArp displays an error message. The user must then insert additional steps (up to the maximum of 10 steps per case) such that the input does not violate the Rule of 3’s.

Alternatively, the user may choose to enter only the final time and use the **Fill** button to generate data for the time specified (this option is generally recommended). The time steps generated by OrigenArp may be modified by simply editing the fields. OrigenArp checks the data for validity whenever the user selects the **Apply** or **OK** button.

The screenshot shows the 'Decay' case form. At the top is a toolbar with icons for Ok, Apply, Reset, Help, Previous, Next, Cancel, Fill, Insert, Delete, Options, and Element. Below the toolbar, the form is titled 'Decay Case # 4'. It contains several input fields: 'Title' (Case 2), 'Basis' (1 MTU), 'Beginning Time' (0.000000e+000), 'Time Units' (Days), '(Alpha,n)' (UO2), '(Alpha,n) Cutoff' (1e-005), 'Alpha Groups' (200), 'Bremsstrahlung' (UO2), and 'Gamma Library' (Total). A table titled 'Time at which output is desired' has three columns: 'Cumulative Time', 'Source Spectra', and 'Save Results'. The table has rows for 0.1, 0.3, 1, 3, 10, 30, 100, 125, and two empty rows. Each row has a checkbox in the 'Source Spectra' and 'Save Results' columns. At the bottom right, there is a checkbox labeled 'Print Neutron Source Calculation Details'.

Fig. 19. Decay case form.

The **Source Spectra** check boxes are used to request neutron and gamma source term spectra edits for any specified time step. These are printed by ORIGEN according to the energy group structures designated in the **Neutron** and **Gamma Groups** forms. If “None” is selected for group structures on both of those forms, requesting an edit on this screen has no effect.

The option to write restart data for a time step is set by clicking the **Save Results** check box for the desired time step. Results may be saved for any or all time steps. Only results from saved time steps are available to plot.

The **Options** button displays a dialog that allows the user to specify output options. The default options may be sufficient for most user needs. The **Insert** and **Delete** buttons allow the user to insert or delete a case. New cases may be inserted before any existing case. By default, the new case is inserted immediately before the present case. Likewise, the **Delete** option may be used to delete any case in the sequence and defaults to the current case.

Neutron and gamma source options are listed on the upper right-hand side of the form. These include **(Alpha,n)**, **(Alpha,n) Cutoff**, **Alpha Groups**, **Bremsstrahlung**, and **Gamma Library**.

(Alpha,n) specifies the composition matrix type used in the (alpha,n) neutron source calculation. There are three options: “UO₂,” “Borosilicate Glass,” and “Problem Specific.” “UO₂” and “Borosilicate Glass” use fixed compositions for these materials regardless of the compositions in the case. “Problem Specific” uses the compositions as specified in the case. For materials other than UO₂ or borosilicate glass, the “Problem Specific” option should be selected.

(Alpha,n) Cutoff allows the user to drop low-importance sources and target nuclides in the (alpha,n) calculation.

Alpha Groups sets the number of alpha energy bins used to represent the continuous alpha slowing-down expression used in solving the (alpha,n) neutron yield. The default value is 200 groups. The (alpha,n) sources are then calculated by representing the continuous slowing down of each alpha particle in the medium between its initial energy (E_{max}) to its final energy (zero) in 200 discrete energy bins. The default value is adequate for most applications.

Bremsstrahlung defines the medium used to generate the Bremsstrahlung component of the gamma radiation source.

Gamma Library selects the group of nuclides (Total, Light Elements, Actinides, Fission Products) used to generate the gamma radiation source.

Print Neutron Source Calculation Details turns on flag for this optional output edit.

For more information on these options, please refer to the [SCALE Manual Sect. F7 (ORIGEN-S)].

7.9 FILL FORM OPTION FOR DECAY CASES

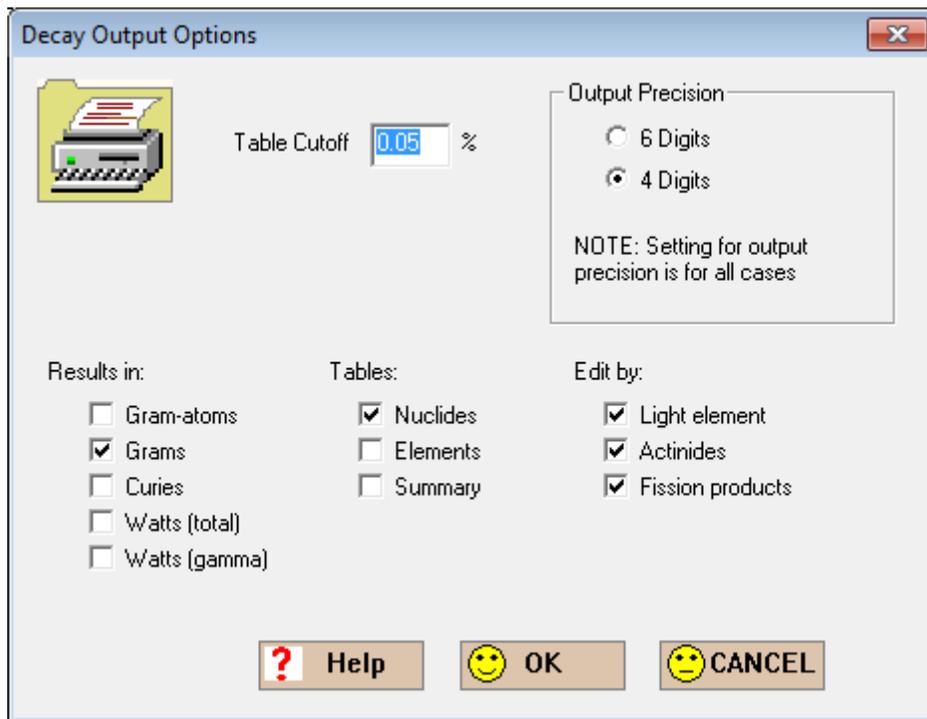

The **Fill** button allows the user to quickly generate decay input data for a given period of time. To use this option, the user inserts a total time in the first row of the time table and then clicks the **Fill** button. OrigenArp will generate time steps that do not violate the Rule of 3's, using as many pages as needed such that each page contains no more than ten time points.

For example, with a total time of 3000, OrigenArp will generate time steps of 1, 3, 10, 30, 100, 300, 1000, and 3000. This feature is designed to allow the user to specify only the total time for a decay cycle and then let OrigenArp determine the time steps needed to ensure accurate results.

7.10 OPTIONS FOR DECAY CASES

The **Decay Output Options** form (Fig. 20) controls the output options for decay cases. Once set, the options stay in effect until they are changed in a subsequent case. ORIGEN allows the cutoff for the “Decay Output” edits to be in the units of percent of the total. In order to simplify the output edits menu, the choices possible in the ORIGEN 65\$ array have been reduced by grouping according to the three dimensions of the array. This procedure may result in more output than desired in some cases. The SCALE input file generated by OrigenArp has been formatted and labeled by subgroups so that an experienced ORIGEN user can easily modify the input by turning on or off individual edit options in the 65\$ array.

The dialog box titled "Decay Output Options" contains the following elements:

- Table Cutoff:** A text box containing "0.05" followed by a percent sign (%).
- Output Precision:** A group box containing two radio buttons: "6 Digits" (unselected) and "4 Digits" (selected). Below them is a note: "NOTE: Setting for output precision is for all cases".
- Results in:** A list of checkboxes: "Gram-atoms" (unselected), "Grams" (selected), "Curies" (unselected), "Watts (total)" (unselected), and "Watts (gamma)" (unselected).
- Tables:** A list of checkboxes: "Nuclides" (selected), "Elements" (unselected), and "Summary" (unselected).
- Edit by:** A list of checkboxes: "Light element" (selected), "Actinides" (selected), and "Fission products" (selected).
- Buttons:** Three buttons at the bottom: "Help" (with a question mark icon), "OK" (with a smiley face icon), and "CANCEL" (with a frowny face icon).

Fig. 20. Decay output options form.

7.11 INSERT CASE

The **Insert Case** form (Fig. 21) allows you to specify the type of case to insert (i.e., **Decay** or **Irradiation**) and the insert location. The new case will be inserted immediately before the selected case.

A screenshot of the 'Insert Case' dialog box. The title bar says 'Insert Case'. Inside, there is a section 'New Case Type' with two radio buttons: 'Decay' (selected) and 'Irradiation'. The 'Decay' option has a yellow arrow icon, and the 'Irradiation' option has a radiation symbol icon. Below this, it says 'New case will be inserted before the selected case.' There is a dropdown menu labeled 'Select case' with the text '2 Decay - Balakova-2, Sample 15, Cas'. At the bottom, there are three buttons: 'Help' (with a question mark icon), 'OK' (with a smiley face icon), and 'CANCEL' (with a sad face icon).

Fig. 21. Case data form.

7.12 DELETE CASE

The **Delete Case** form (Fig. 22) allows you to specify a case to delete. Select a case from the list and click the **Delete** button.

A screenshot of the 'Delete Case' dialog box. The title bar says 'Delete Case'. Inside, it says 'Select Case to delete' above a dropdown menu. The dropdown menu shows '2 Decay - Balakova-2, Sample 15'. At the bottom, there are three buttons: 'Help' (with a question mark icon), 'Delete' (with a red 'X' icon), and 'CANCEL' (with a smiley face icon).

Fig. 22. Delete case form.

7.13 ELEMENT FRACTIONS

The **Element Fractions** form (Fig. 23) is an optional screen that allows you to keep or remove all or a fraction of the specified elements from the previous case. This option can be used to approximate keeping (or removing) a portion of the elements that are of particular interest. For example, to obtain a cobalt-only source, specify the **Keep** option and select the element cobalt (Co). In the example shown in Fig. 23, the **Remove** option is used to remove all of the xenon (Xe) inventory from the problem by setting the removal fraction to unity. Elements are removed at the start of the case in which the fractions are set.

The **Select Elements** list box is a multiple-selection list box. To select a single element, simply click that item. To select additional elements, the **Ctrl** key should be held down while making the selection. To select a range of items, hold down the **Shift** key.

Specify Element Fractions To Keep or Remove

n/m Element Fractions

Select Elements

- 51-Sb
- 52-Te
- 53-I
- 54-Xe
- 55-Cs
- 56-Ba
- 57-La
- 58-Ce

Keep

Remove

Select elements to keep or remove. The default fraction for elements that are selected is 1. You may change that after selecting the element(s).

With the keep option, the fractions of the elements selected will be kept, and all other elements will be removed. With the remove option, the fractions of the elements selected will be removed, and all other elements will be kept in their entirety.

Element	Fraction
Xe-54	1

OK CANCEL Clear Help

Fig. 23. Element fractions form.

7.14 SUMMARY VIEW

The **Summary View** (Fig. 24) displays the data for the active input in text mode. The purpose is to aid the user in reviewing, understanding, documenting, or debugging input. **Print** or **Print Preview** (in the **File** pulldown menu) can be used to print a copy of the summary.

Fig. 24. Summary view.

7.15 PLOT SETUP

The **Plot Setup** form (Fig. 25) allows you to request specific output quantities tabulated in a text table that contains only the requested data. This table may be plotted by PlotOPUS or imported into another program for analysis and/or visualization. The requested results may include nuclide data, element data, neutron spectra, or gamma spectra. The available isotopic and element units are selected from the **Output Units** pulldown menu and include for **Nuclides** and **Elements**: Grams, Gram-atoms (moles), Curies, Becquerels, Kilograms, Atoms% Wt%, Total Watts, Gamma Watts, Atoms/(barn-cm), Grams/cm³, Absorptions, Air Toxicity, and Water Toxicity. Note that the results generated from the **Plot Setup** form are independent of the ORIGEN output. That is, the user does not need to also request these quantities in the ORIGEN output options. However, any data points that are desired must have been

requested using the **Save results** check box associated with each time step in the irradiation or decay case data.

The **Output Units** for **Gamma Spectra** are photons/s/mev or energy/s/mev. There are no options for **Total Neutron Spectra**, **(Alpha,n) Reactions**, or **Spontaneous Fission**.

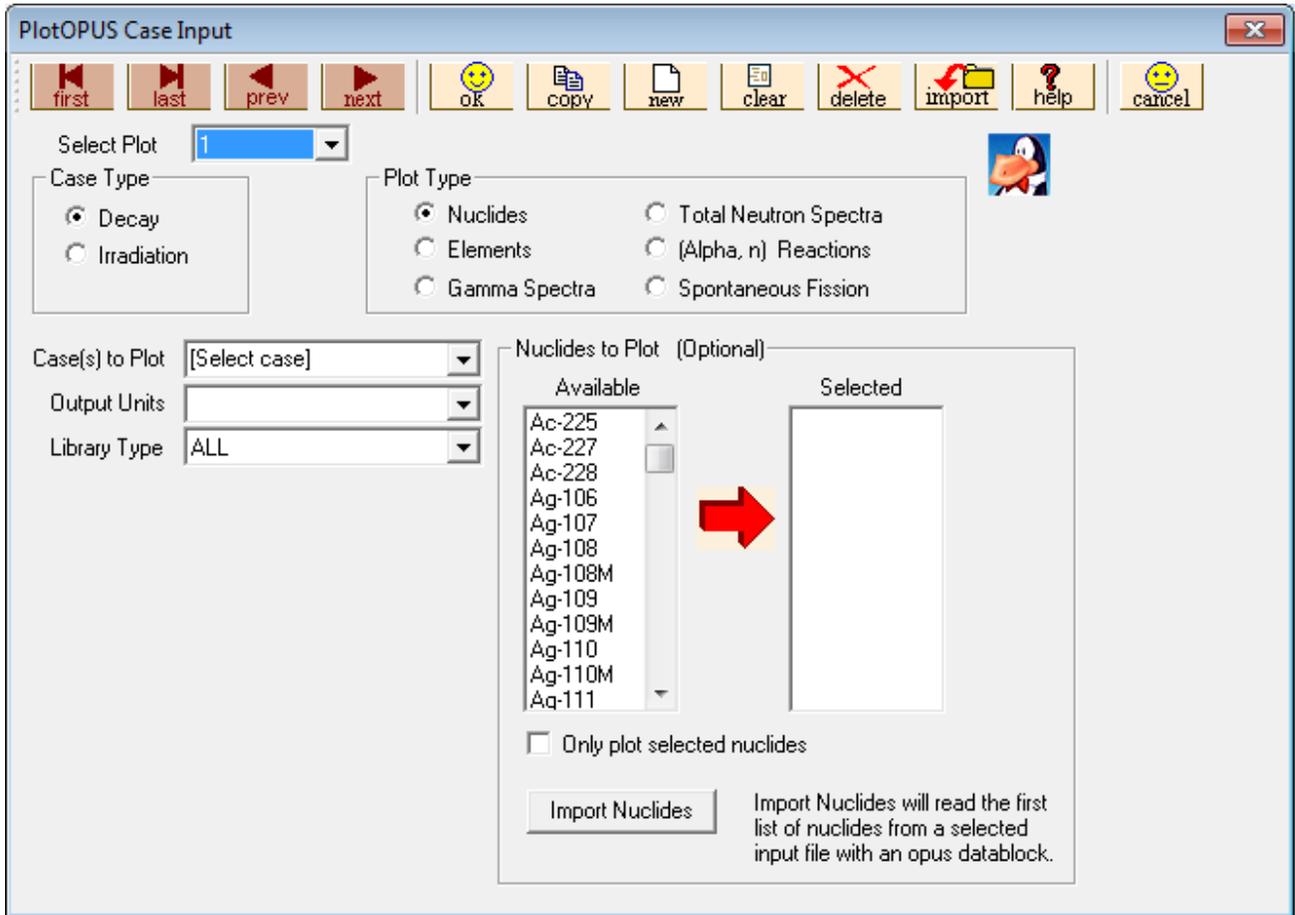

Fig. 25. Plot setup form.

The units of **Atoms%** and **Wt%** have special meaning. When selected, the user must set the **Plot Type** radio button to **Elements** and then select the element(s) for which plot data are desired in the **Nuclides to Plot** dialog. OrigenArp will then produce a table of the isotopic distribution (in weight percent or atom percent) for all isotopes of the selected element(s). To activate the dialog box, it must be clicked once to activate. Once activated, any nuclide or element selected by clicking on it will appear in the **Selected** box to the right. A range of nuclides may be selected by holding the **Shift** key after the first selection, and then making a second selection. To remove any nuclide from the **Selected** field, simply click on it. You can skip to any part of the nuclide list by typing the first letter of the desired nuclide.

For most plots types, if no nuclides are explicitly requested, the top-ranking nuclides are automatically printed in the output table. Selecting several nuclides will ensure they also appear in the output table, regardless of their relative ranking. If the user selects nuclides and then checks **Only plot selected nuclides**, only the selected nuclides will be plotted and no others.

Library Type refers to the group of nuclides to be included in the output plot tables. The default is **All** which includes light elements (structural materials), actinides, and fission products. For example, if the total decay heat is requested, the output table will include any nuclide that contributes significantly to the decay heat, regardless of origin. The total value, listed in the output table (and plotted), represents the total for all nuclides in the problem (not just those listed). If the user were to select the **Library Type Actinides**, then only the actinide nuclides will be included, and the total will represent the total actinide contribution to the problem.

After plot data are specified in the **Plot Setup** form, the user may add more plots by clicking the **New** button on the toolbar at the top of the form. The additional plots will be added to the **Select Plot** field from which previously defined plots can be selected and edited, or deleted. A separate plot file and table in the output file will be generated for each plot requested.

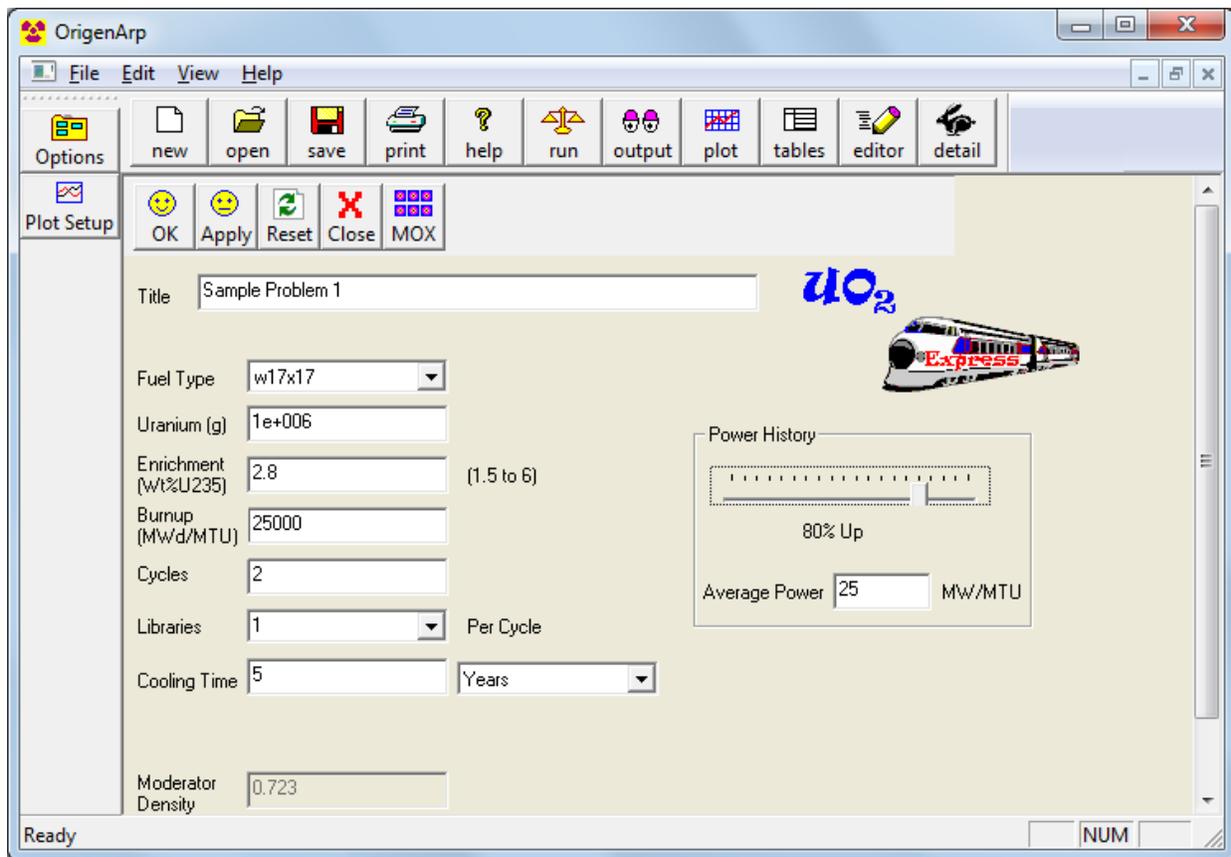

8. SAMPLE PROBLEM 1: EXPRESS FORM

This problem models three cycles of a Westinghouse 17×17 PWR fuel assembly (i.e., w17x17) with an **Enrichment** of 2.8 wt % ^{235}U . The basis for this model is 1 MTU of fuel (i.e., $1\text{e}+006$ g Uranium). The **Power History** indicates that the reactor is in operation 80% of the time with an assembly **Average Power** of 25 MW/MTU for 2 **Cycles** with a **Burnup** of 25000 MWd/MTU. **Cooling Time** after final discharge is 5 years. The **Moderator Density** is fixed at the default value in ARPDATA.TXT.

The following steps are used to create, execute, and generate plots for this sample demonstration problem.

8.1 USE EXPRESS FORM TO SET UP THE PROBLEM

Enter the input data specified above in the **Express** form as shown in Fig. 26.

The screenshot shows the OrigenArp software interface. The main window is titled "Sample Problem 1". The "Express" form is displayed with the following input fields and values:

- Title: Sample Problem 1
- Fuel Type: w17x17
- Uranium (g): 1e+006
- Enrichment (wt%U235): 2.8 (range: 1.5 to 6)
- Burnup (MWd/MTU): 25000
- Cycles: 2
- Libraries: 1 (Per Cycle)
- Cooling Time: 5 (Years)
- Moderator Density: 0.723

The "Power History" section shows a slider set to 80% Up and an Average Power of 25 MW/MTU. The interface also features a menu bar (File, Edit, View, Help), a toolbar with icons for new, open, save, print, help, run, output, plot, tables, editor, and detail, and a status bar at the bottom showing "Ready" and "NUM".

Fig. 26. Express form for sample problem 1.

8.2 SET UP PLOT DATA

Click on the **Plot Setup** button to request plot data for the **Final Decay** case (5-year cooling time) after discharge. OrigenArp will automatically turn on the **Save Results** flags for each time step in the final decay case. In this example, we will plot the decay heat. In the **PlotOPUS Case Input** form (Fig. 27), select **Total Watts** for the **Output Units**. Note we will use the default **Plot Type** of **Nuclides** and the

Library Type of ALL to obtain the data from the largest contributors for all nuclides. Click **OK** on the top toolbar to save the data and close the form.

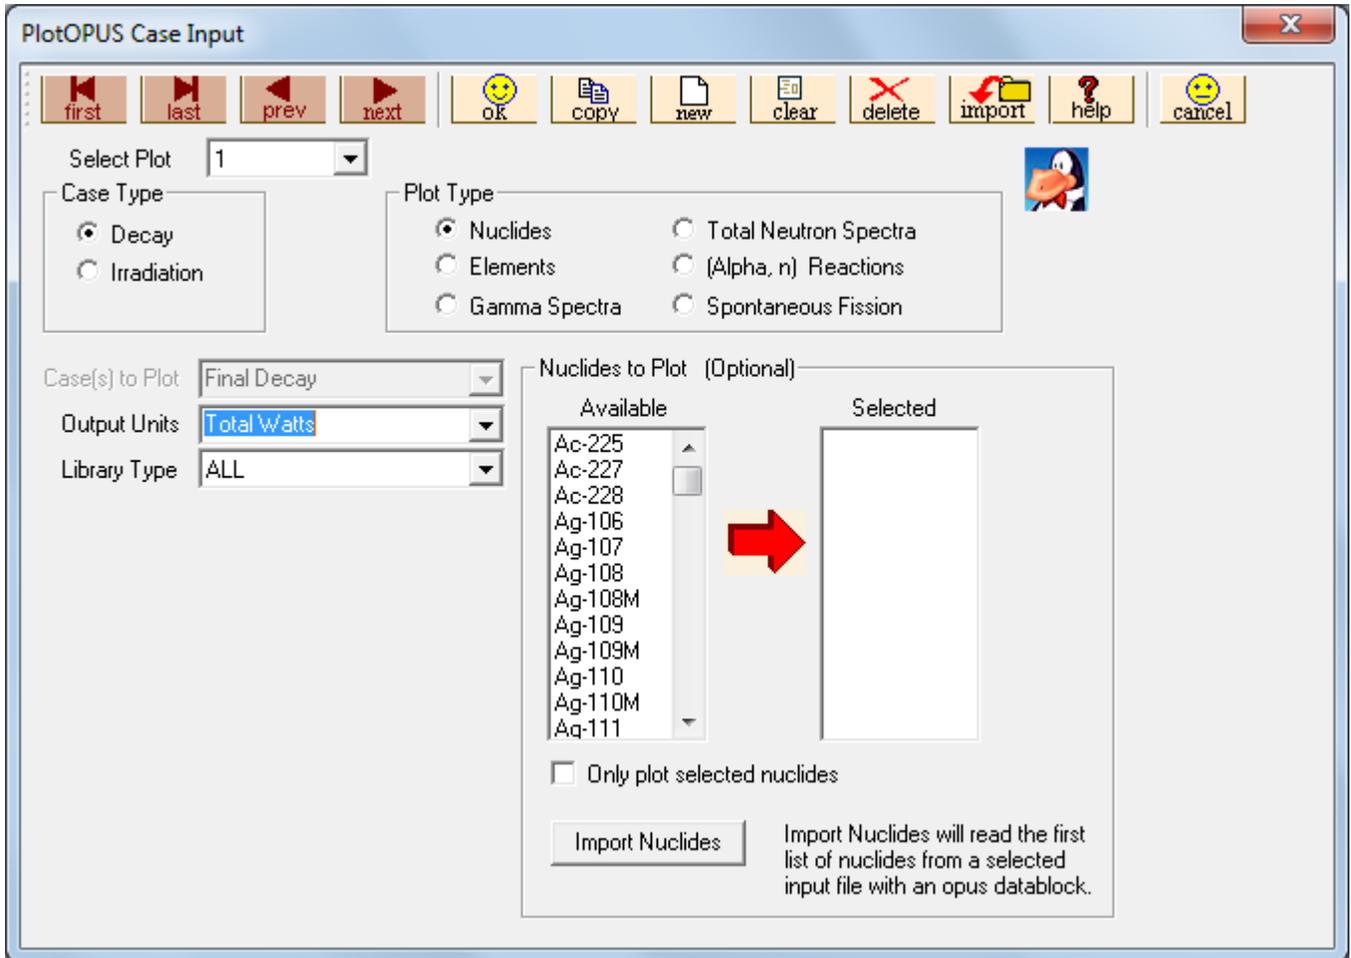

Fig. 27. Plot setup form.

8.3 EXECUTE SCALE

Execute SCALE by pressing the **Run** button. The **Save As** dialog form will open. Go to the folder where you want to save your input and output files. Enter the file name **sample_problem1** for the **File name**. A DOS window will open and display the progress of the calculation. When the calculation is complete, the DOS window appearance should be similar to Fig. 28. You may close the DOS window once execution is completed.

```

Fig. 28. DOS window for execution of sample problem 1.

8.4 VIEW PLOT

You may view the plot results using the PlotOPUS program by selecting the **Plot** button. The plot should be similar to the one in Fig. 29. The nuclide list on the right side of the plot lists the primary contributors in order of importance. Note that PlotOPUS plots the data for the first 14 contributors by default. You can click on the nuclide list to select or de-select nuclides to display. The **Ctrl** and **Shift** keys can be used in combination with the mouse to select multiple nuclides or a group of nuclides similar to other Windows programs.

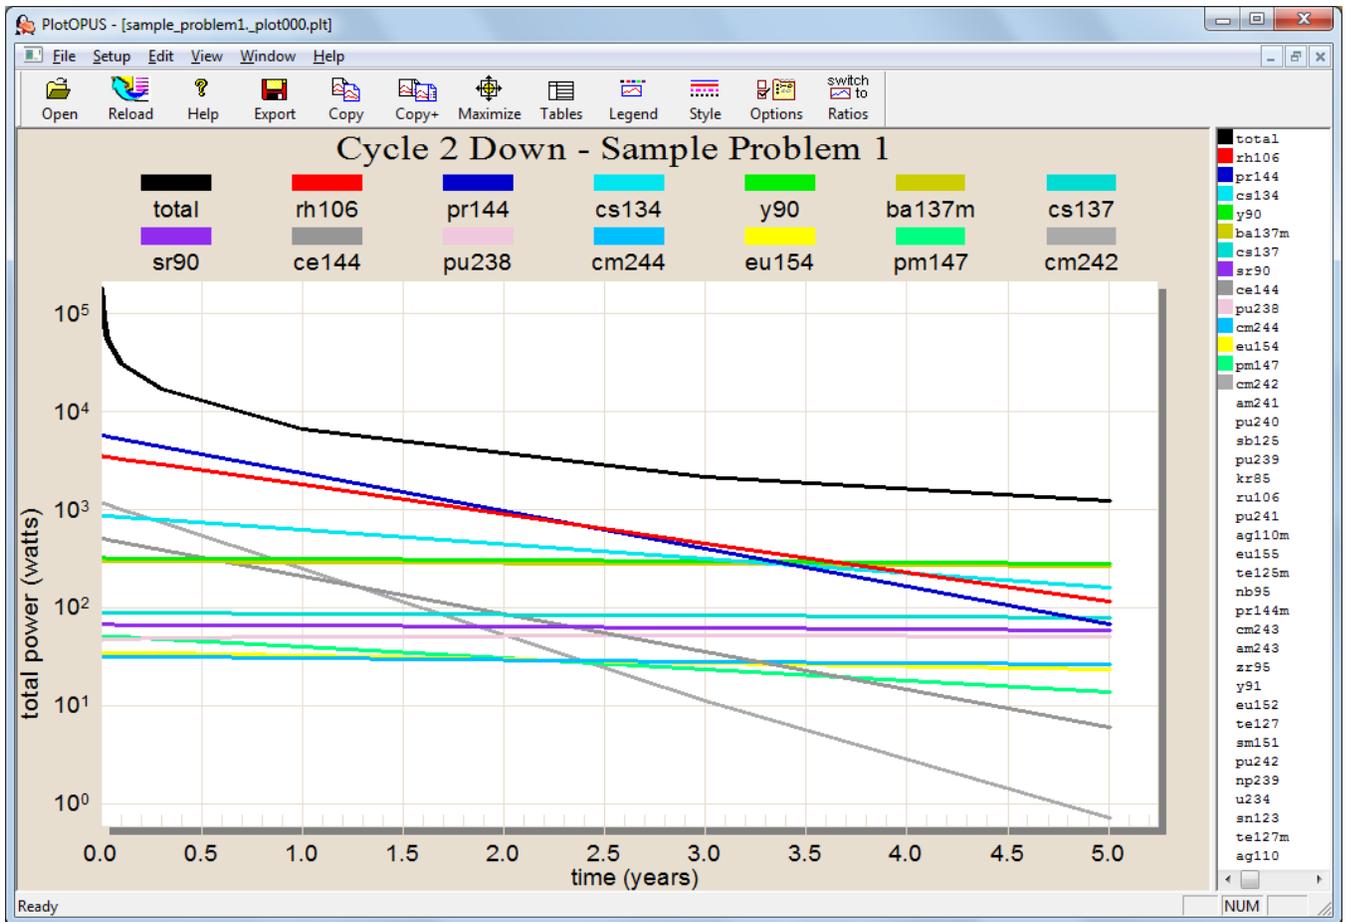

Fig. 29. Plot of decay heat for sample problem 1.

9. SAMPLE PROBLEM 2: DETAIL FORMS

This problem models three-cycle irradiation of a GE 10X10-8 fuel assembly with enrichment of 3.2 wt % ^{235}U . The basis for this model is 1 MTU of fuel. The operating history is shown in Table 1. Assume the moderator density is 0.63 g/cc. The following subsections outline the steps used to set up and run this problem with OrigenArp.

**Table 1. Detailed operating history for
GE 10X10-8 fuel assembly**

Cycle number	Power (MW/MTU)	Cumulative time (days)
1	38	100
	40	175
	41	250
	35	300
	37	350
Refueling	Decay case	49
2	35	100
	0	130
	34	215
	38	300
	33	405
Refueling	Decay case	70
3	16	200
	15	455
Discharge after Cycle 3	Decay case	5 years

9.1 START IN DETAIL MODE

Start OrigenArp in **Detail** mode. If the **Express** form is displayed at startup, select the **Detail** button. Click the **New** button to clear any data from a previous problem. The screen should look like the example in Fig. 30.

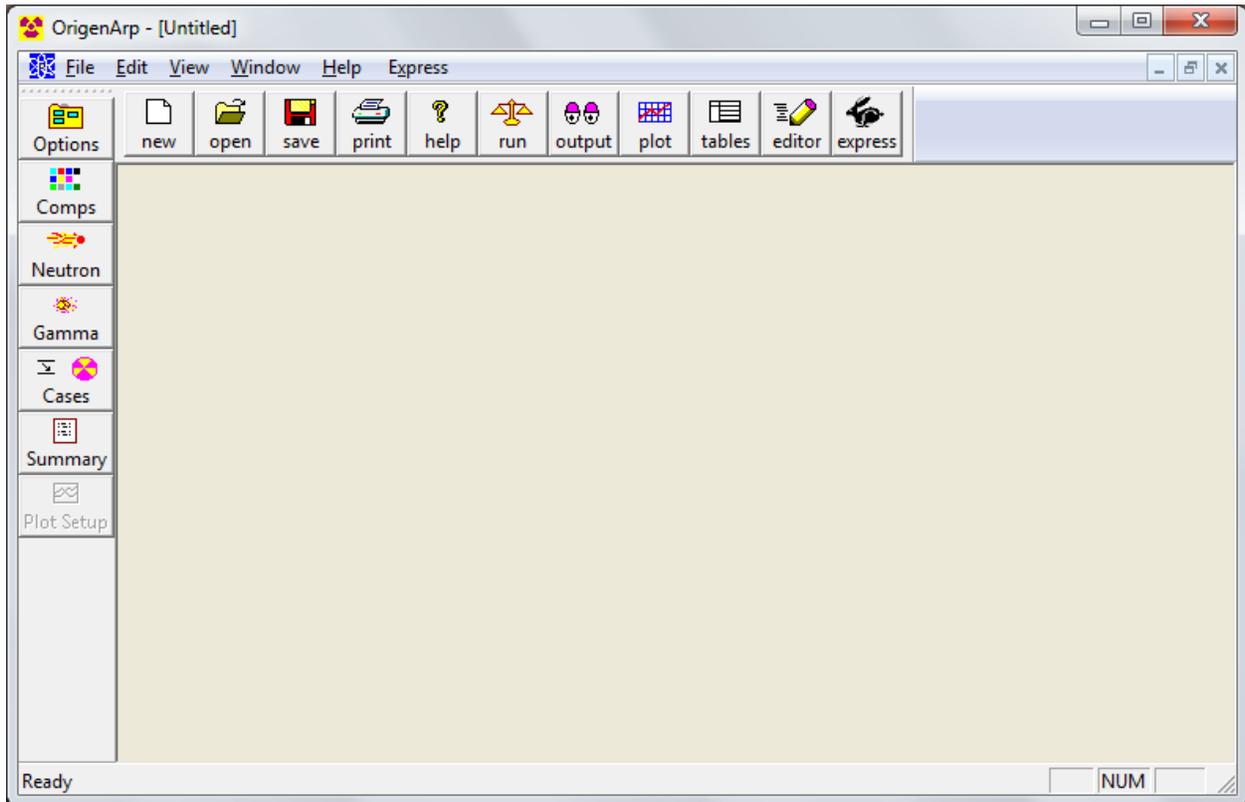

Fig. 30. Detail mode.

9.2 ENTER COMPOSITION DATA AND ENRICHMENT

Select the **Comps** (Compositions) button to access the **Composition Data** form and select the **Fuel Type** (Fig. 31). Select **ge10x10-8** for the **Fuel Type**.

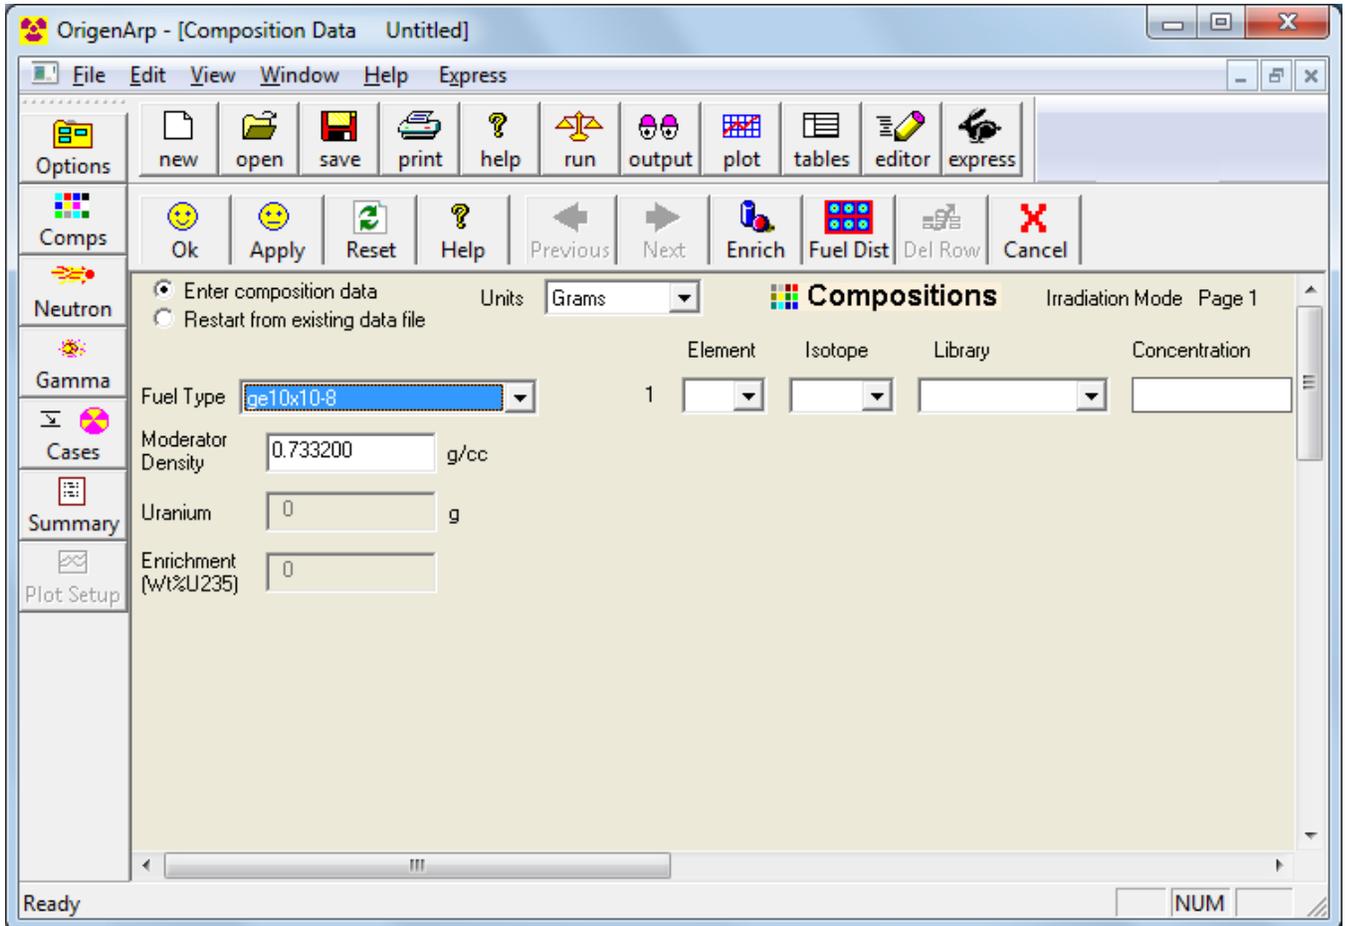

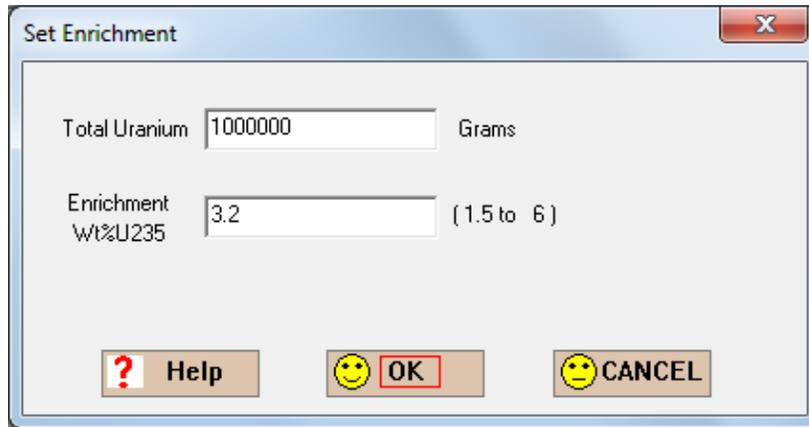

Fig. 31. Composition data form.

Select the **Enrichment** button and enter a value of 3.2 for **Enrichment** on the **Set Enrichment** form (Fig. 32). Use the default value of 1000000 for **Total Uranium** and select **OK**.

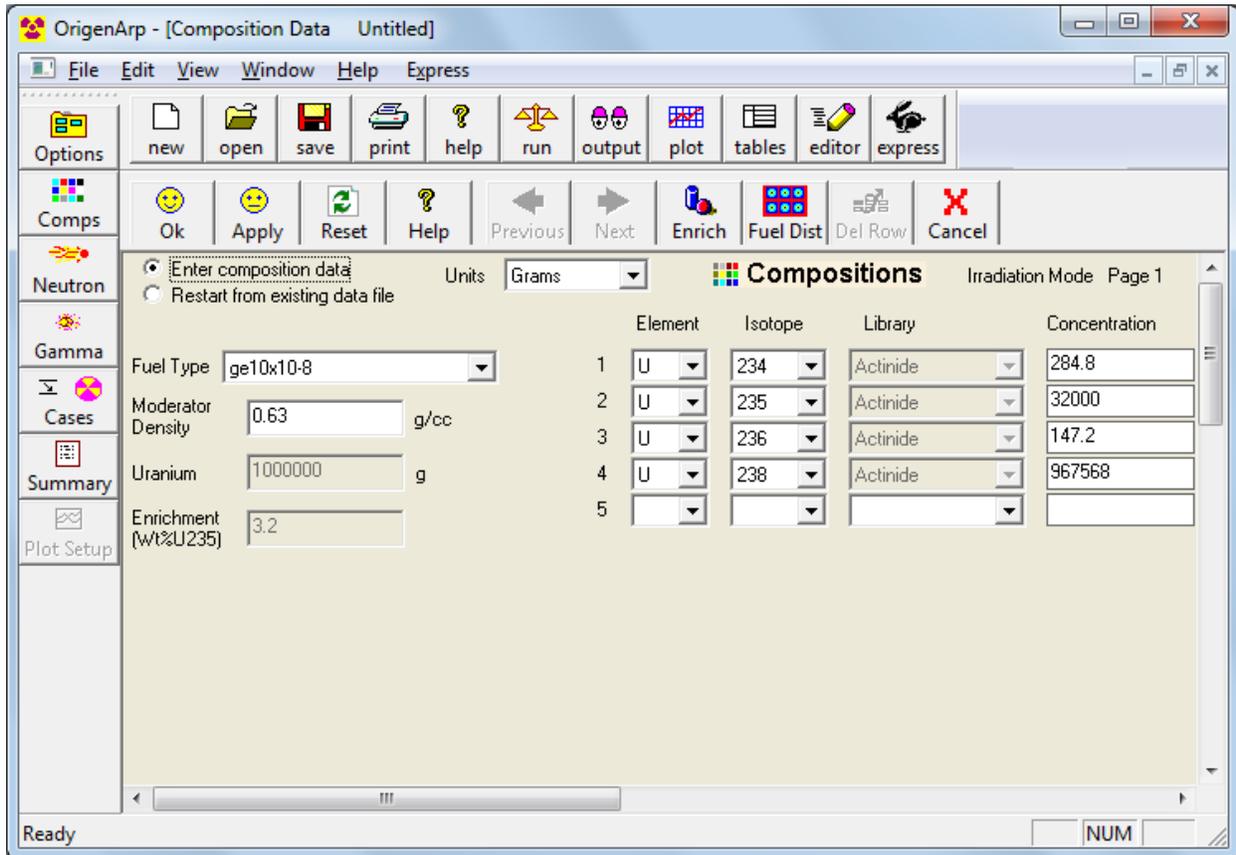

The 'Set Enrichment' dialog box contains the following fields and controls:

- Total Uranium: 1000000 Grams
- Enrichment Wt%U235: 3.2 (1.5 to 6)
- Buttons: Help, OK, CANCEL

Fig. 32. Set enrichment form.

Once you set the **Moderator Density** to 0.63, the **Composition Data** form is complete (Fig. 33). Click **OK** to close the form.

The 'OrigenArp - [Composition Data]' window shows the following configuration:

- Units: Grams
- Compositions Table:

Element	Isotope	Library	Concentration
1 U	234	Actinide	284.8
2 U	235	Actinide	32000
3 U	236	Actinide	147.2
4 U	238	Actinide	967568
5			

Other parameters shown in the window:

- Fuel Type: ge10x10-8
- Moderator Density: 0.63 g/cc
- Uranium: 1000000 g
- Enrichment (Wt%U235): 3.2

Fig. 33. Completed compositions form.

9.3 ENTER NEUTRON AND GAMMA ENERGY GROUPS

To obtain neutron and/or gamma radiation source terms, you must specify the energy group structures that you want ORIGEN to use when it calculates the source terms. Click on the **Neutron** button to open the **Neutron Energy Spectra** form. Select 238GrpSCALE (238GrpENDF5 in older versions) as the **Group Structure** (Fig. 34). Click **OK** to close the form.

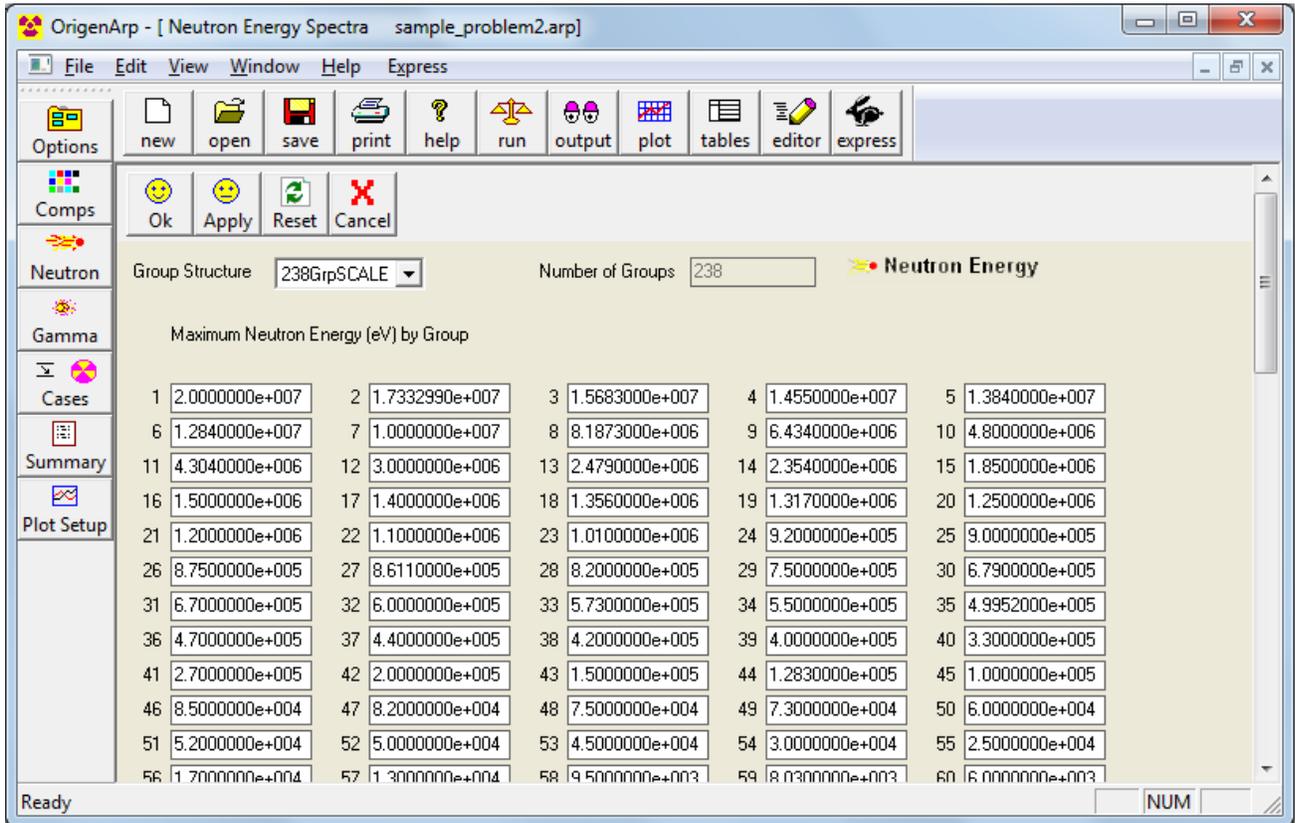

Fig. 34. Neutron energy spectra form.

Click on the **Gamma** button to open the **Gamma Energy Spectra** form. Select 18GrpSCALE5 (18GrpSCALE in older versions) as the **Group Structure** (Fig. 35). Click **OK** to close the form.

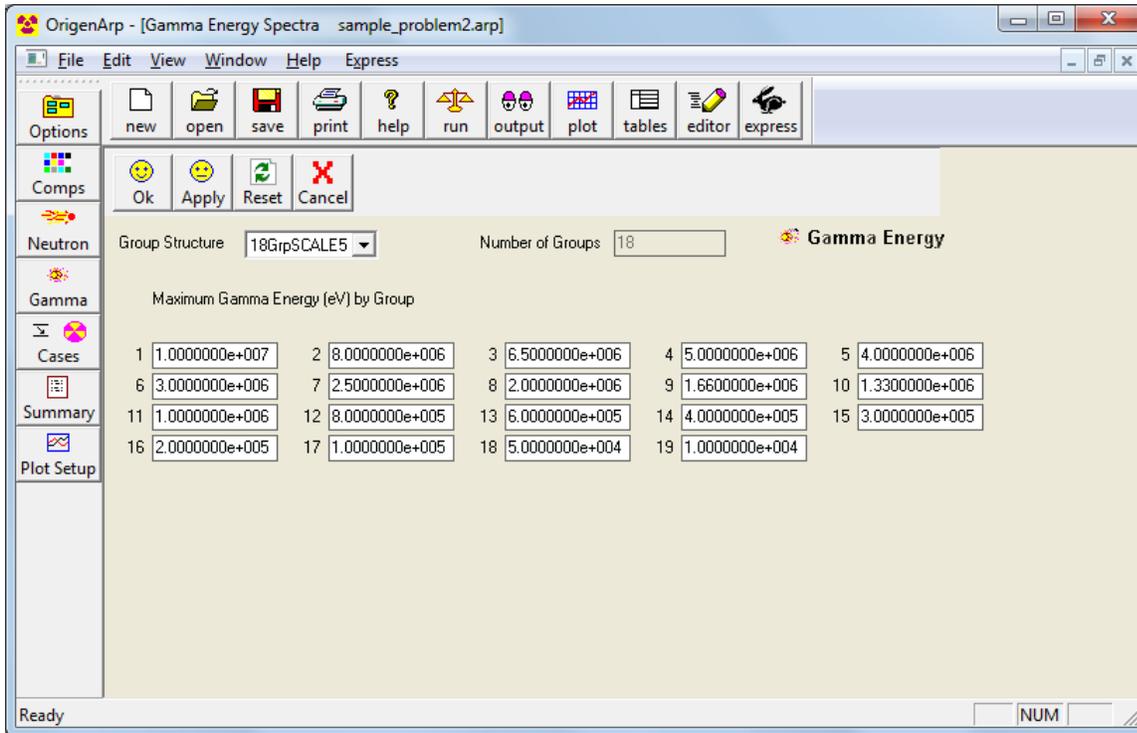

Fig. 35. Gamma energy spectra form.

9.4 ENTER CASE DATA

To enter irradiation (i.e., power history) data, select the **Cases** button to open the **Case Data** form (Fig. 36).

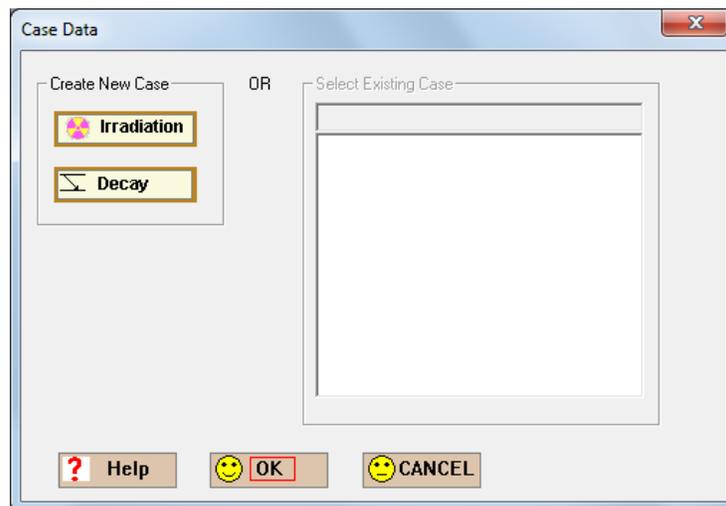

Fig. 36. Case data form.

Select **Irradiation** to open the **Irradiation** form for Case 1 (Fig. 37).

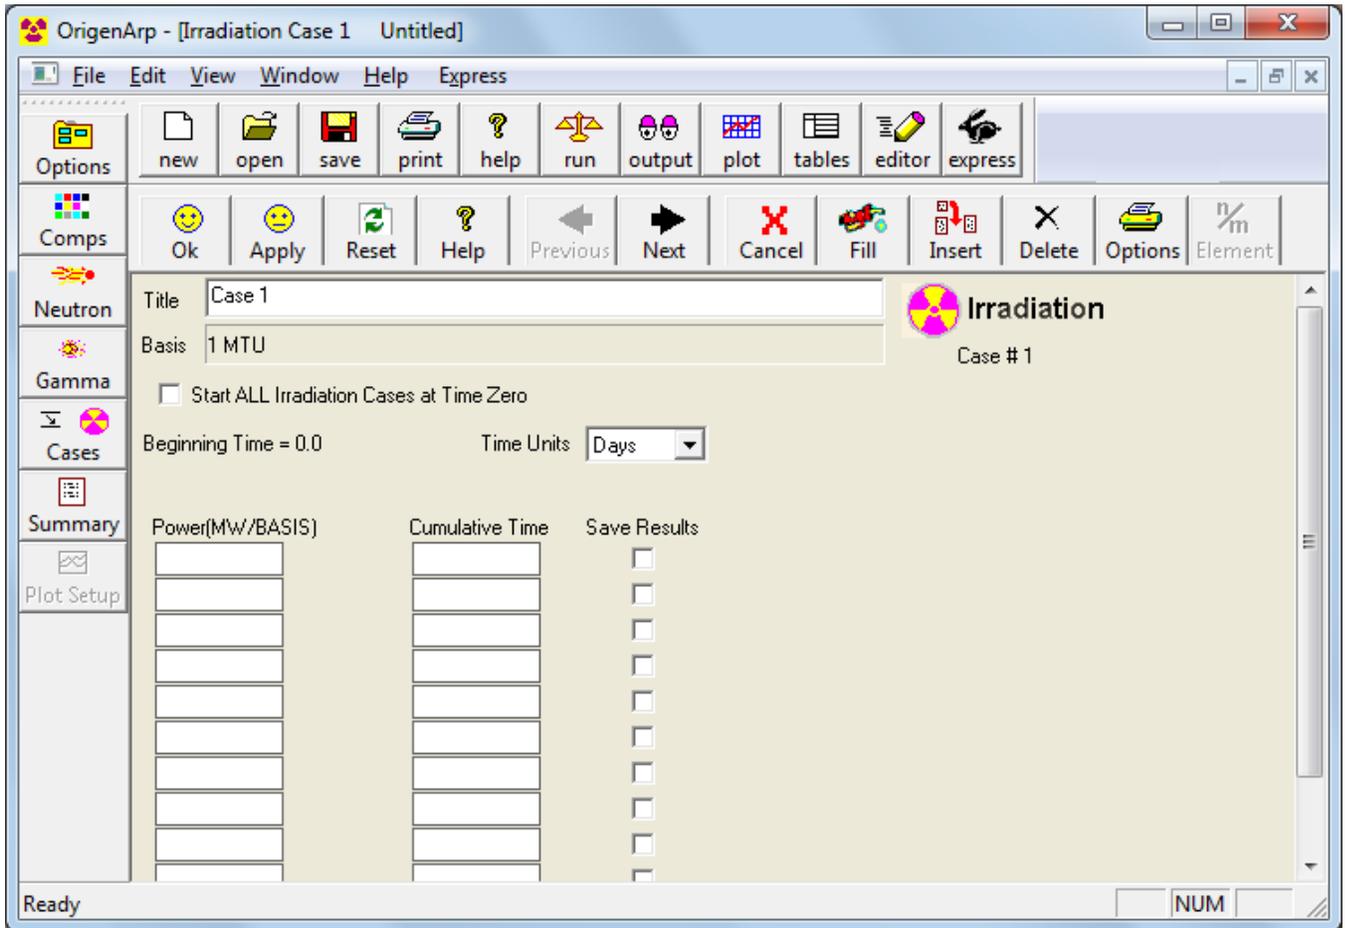

Fig. 37. Irradiation case form.

Enter the irradiation data for Cycle 1 (Fig. 38). Once the data for Cycle 1 are complete, select the **Next** button. You will be returned to the **Case Data** form. Select **Decay** under **Create New Case** to create the refueling case after Cycle 1.

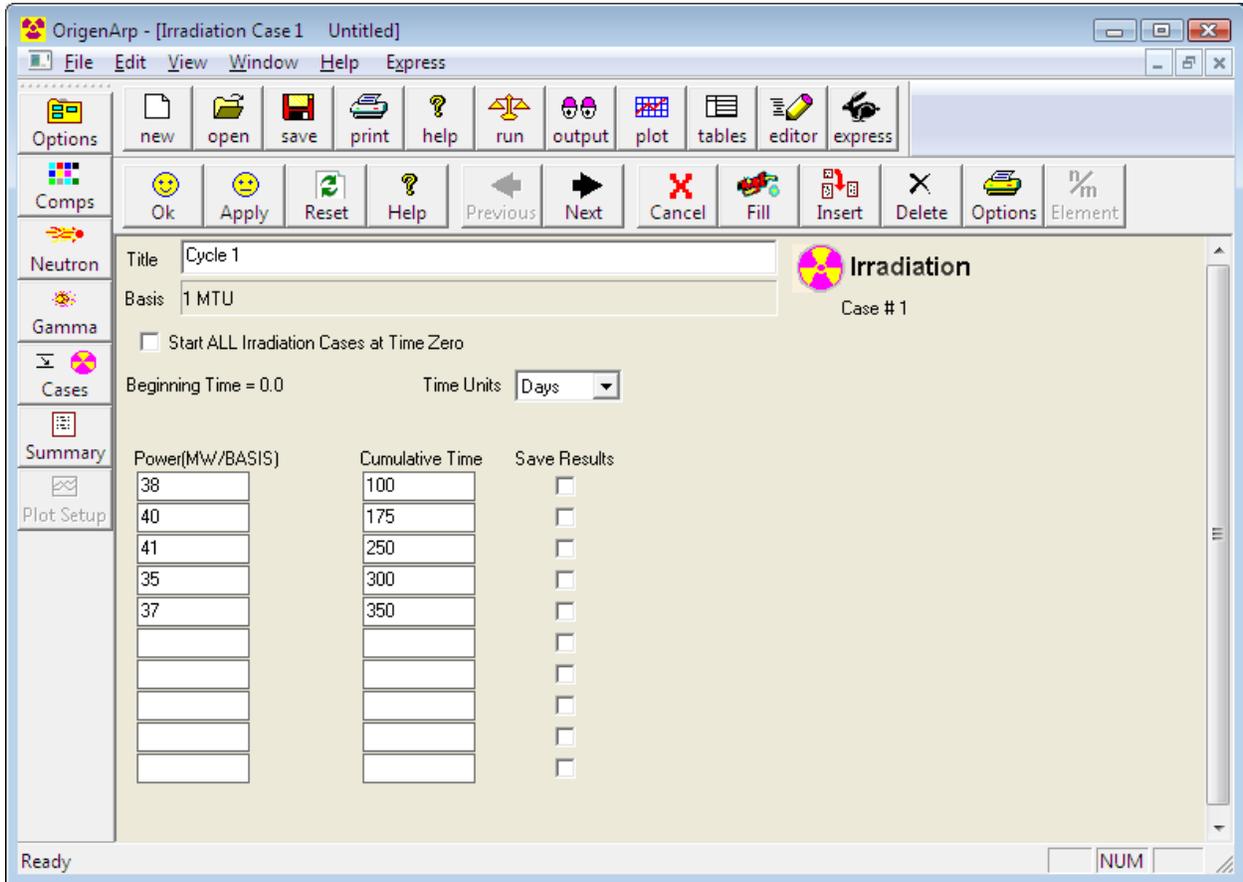

Fig. 38. Irradiation case data for Cycle 1.

The **Decay Case** form will be displayed (Fig. 39). Enter 49 for the **Cumulative Time** in Days, which are the default **Time Units** on the form.

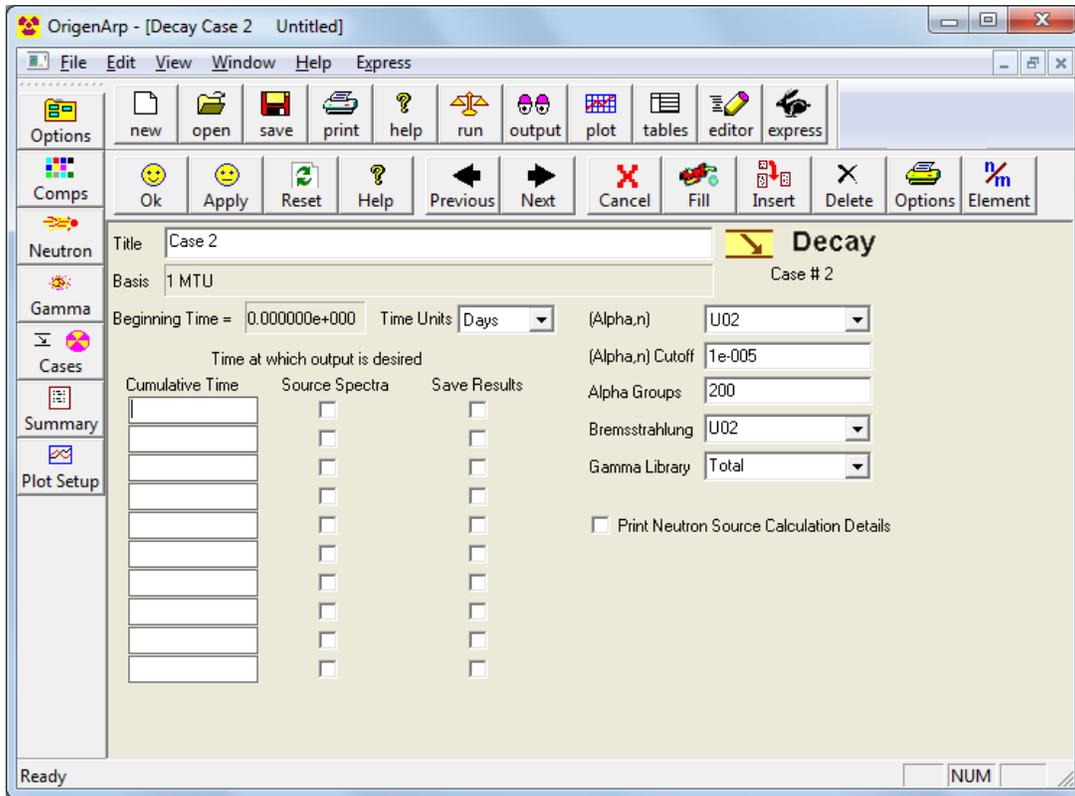

Fig. 39. Decay case form.

Click on the **Fill** button so that OrigenArp will automatically fill the form with intermediate time steps (Fig. 40).

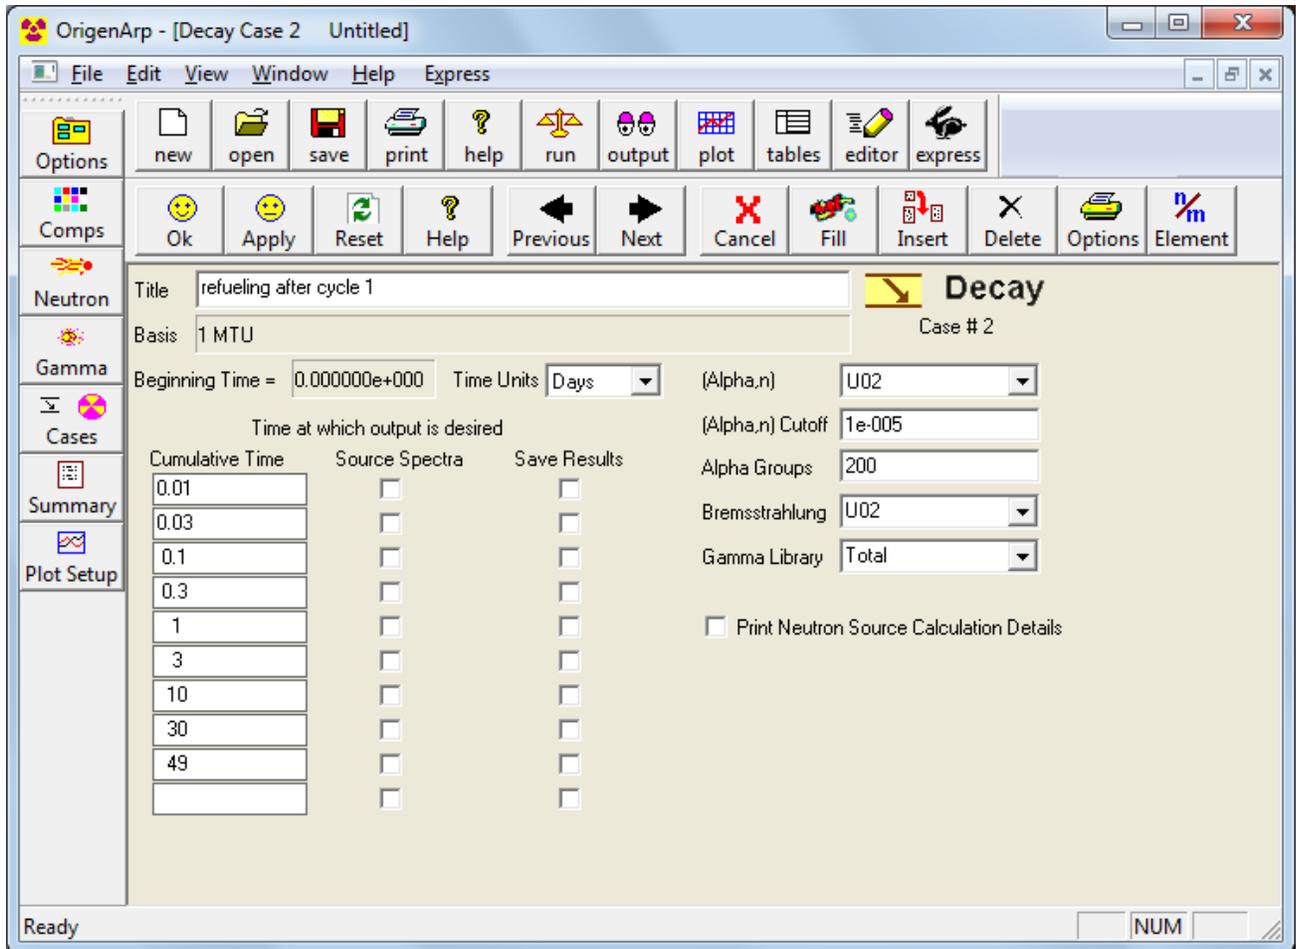

Fig. 40. Decay case for refueling after Cycle 1.

Click **Next** and create a new irradiation case for Cycle 2. When you complete the form and click **Next**, you will see a warning message “Time step exceeds 100 days,” which is the recommended maximum size in ORIGEN-ARP. Check the box “DO NOT WARN me...Just make the time adjustments” and click **Yes**. OrigenArp automatically divides the time step into multiple steps that are less than or equal to 100 days. In this case, the final time step that was 105 days long is divided into two equal steps of 52.5 days. The completed form should appear as shown in Fig. 41.

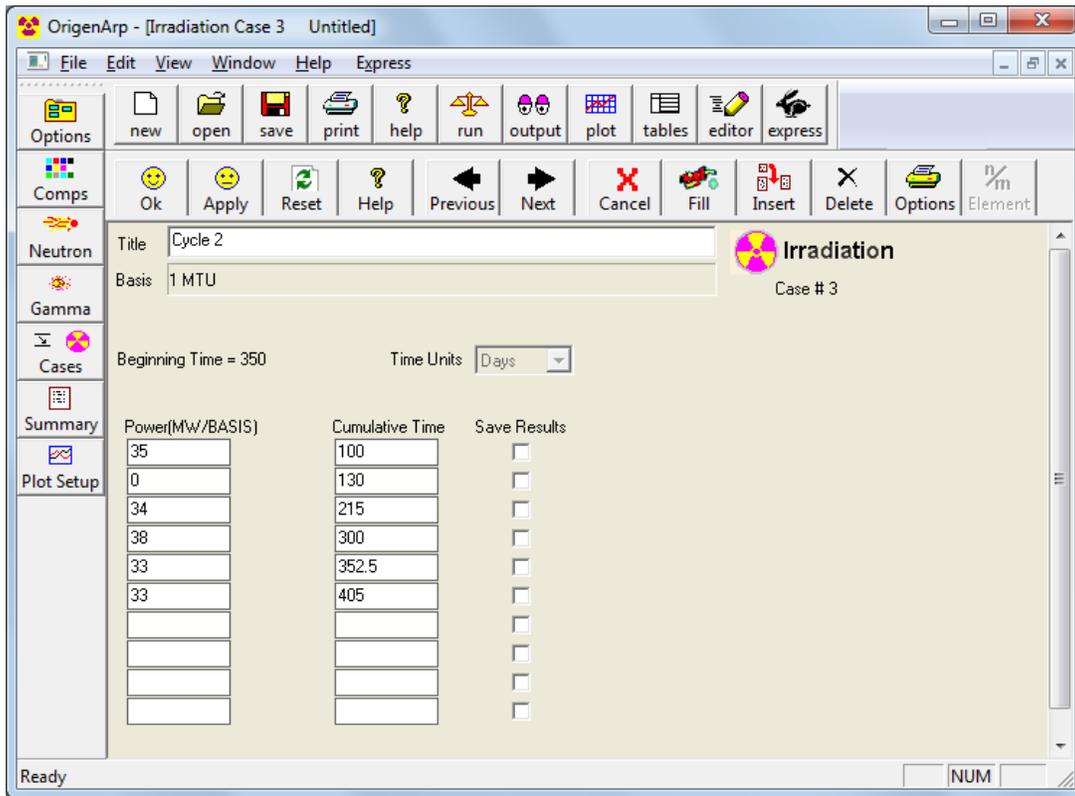

Fig. 41. Irradiation case for Cycle 2.

Click **Next** and create a new decay case for the refueling after Cycle 2. Enter 70 for the **Cumulative Time** and click on the **Fill** button so that OrigenArp automatically fills the form with intermediate time steps. The completed form should look like Fig. 42.

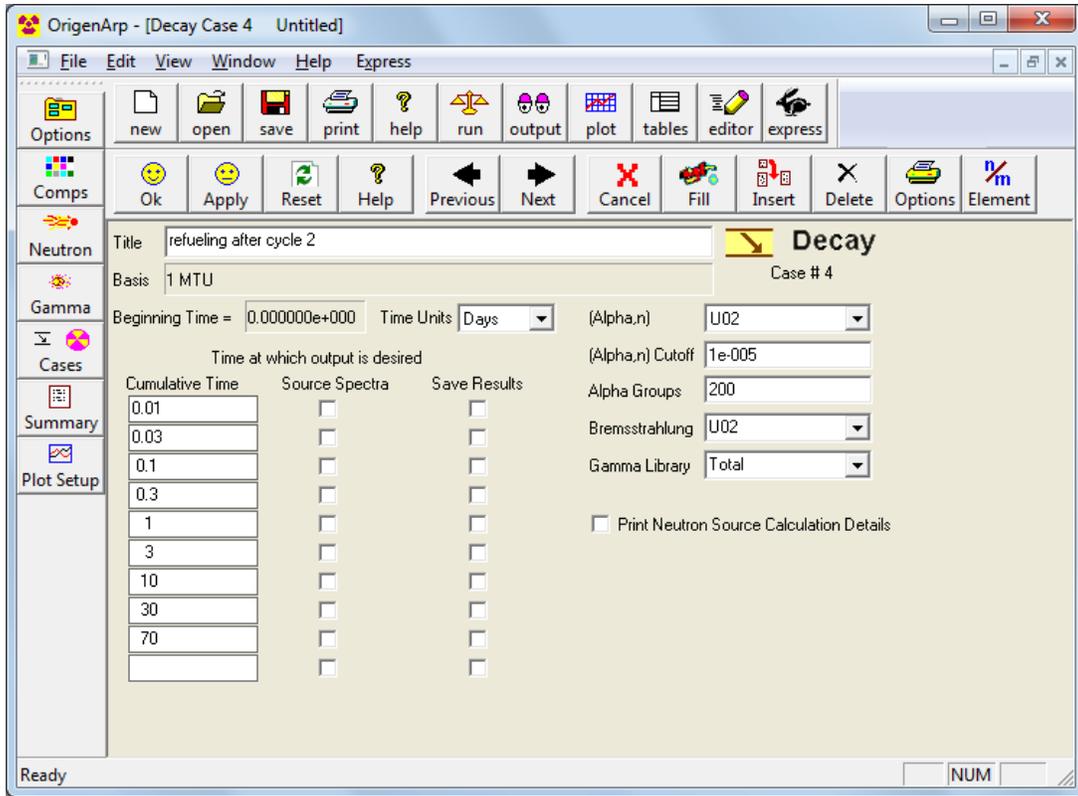

Fig. 42. Decay case for refueling after Cycle 2.

Create a new irradiation case for Cycle 3 (Fig. 43).

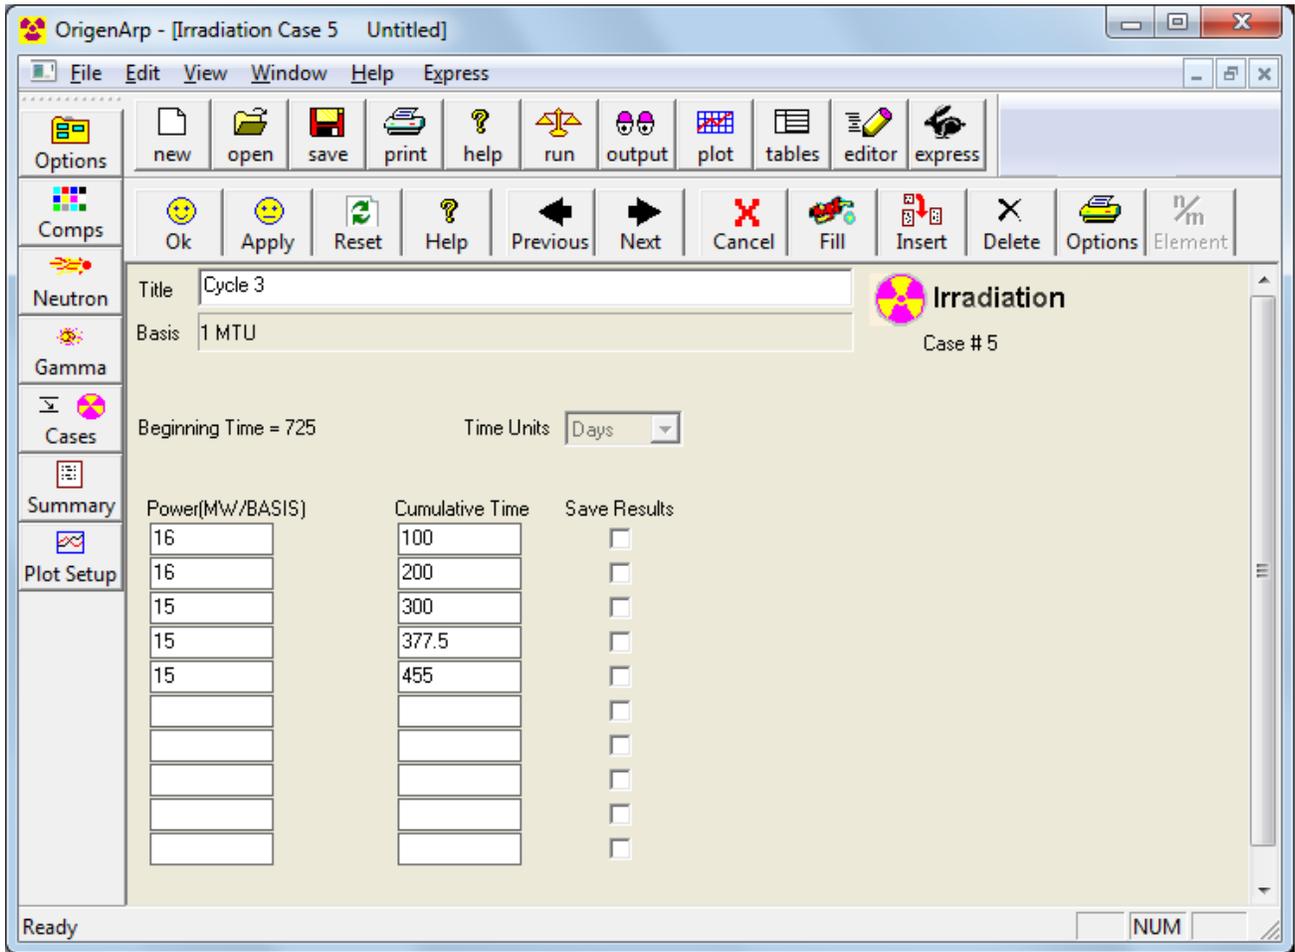

Fig. 43. Irradiation case for Cycle 3.

Finally, create a new decay case for discharge after Cycle 3 (Fig. 44). Change the **Time Units** to **Years**, specify 5 as the **Cumulative Time** and check the **Source Spectra** and **Save Results** boxes as shown in Fig. 44. Because source terms and plots are desired for this final case, the **Source Spectra** and **Save Results** check boxes must be checked.

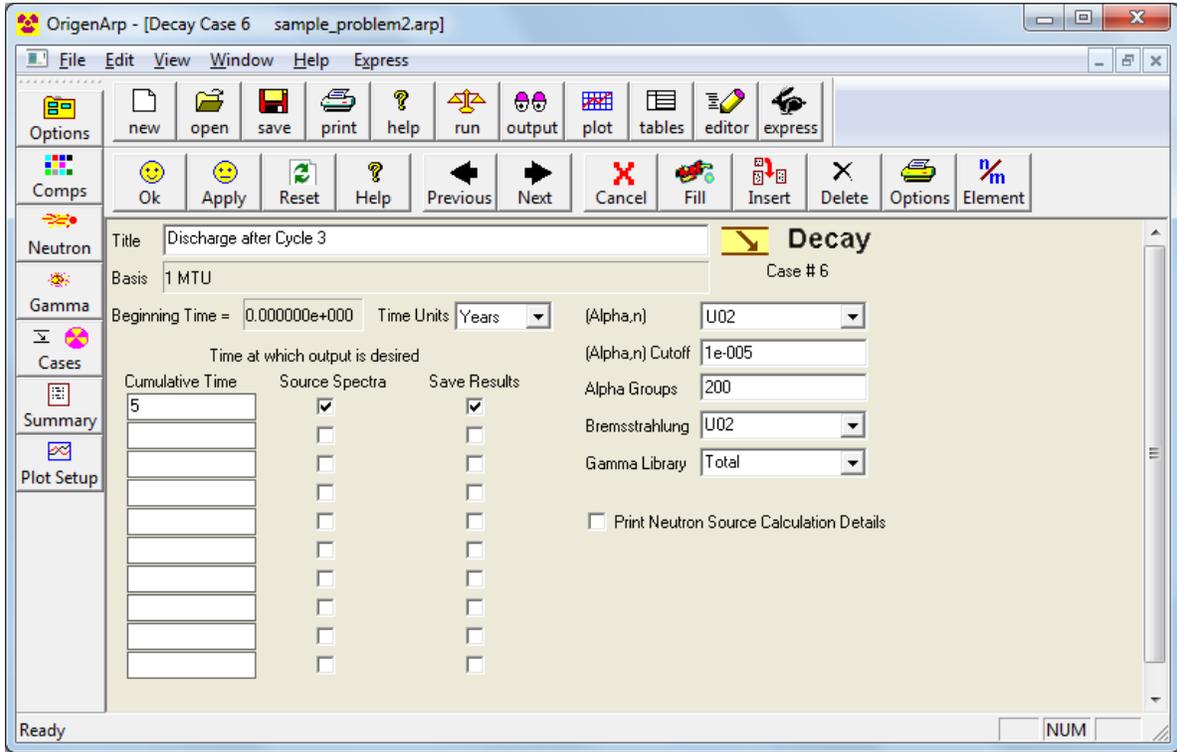

Fig. 44. Final decay case for 5-year discharge.

Click the **Fill** button to have OrigenArp automatically fill in the needed intermediate time steps. The form should look like Fig. 45. Click **OK** to close the form and save data.

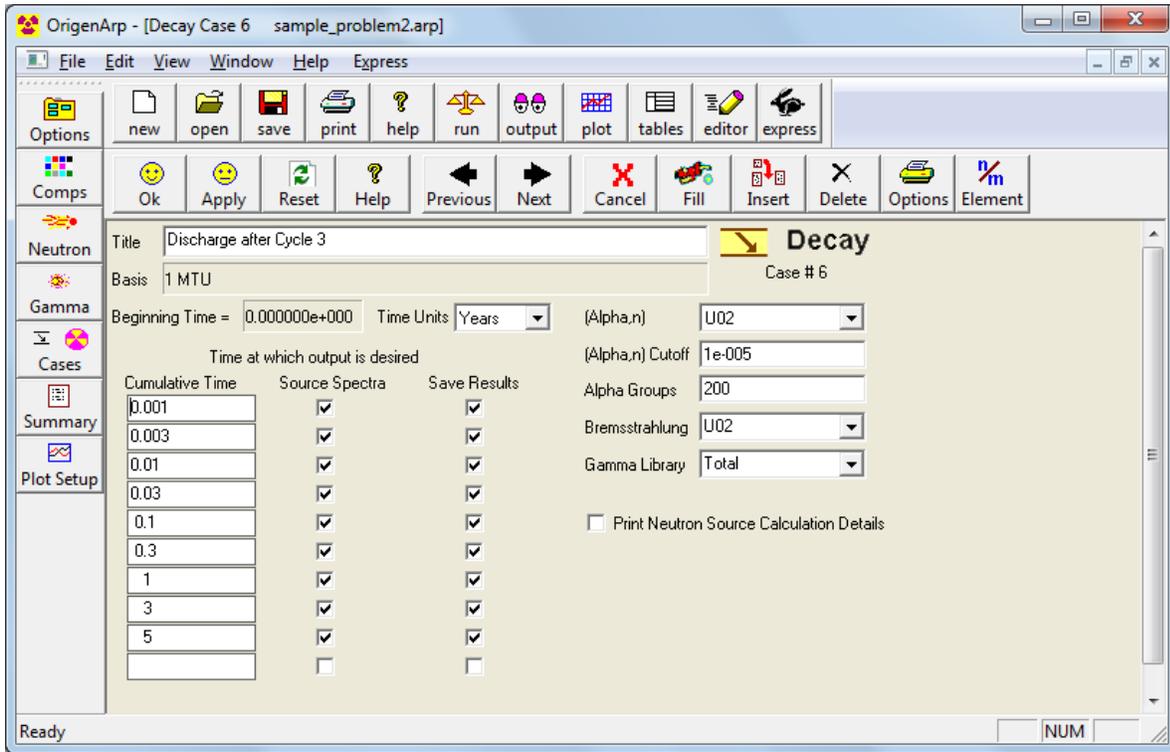

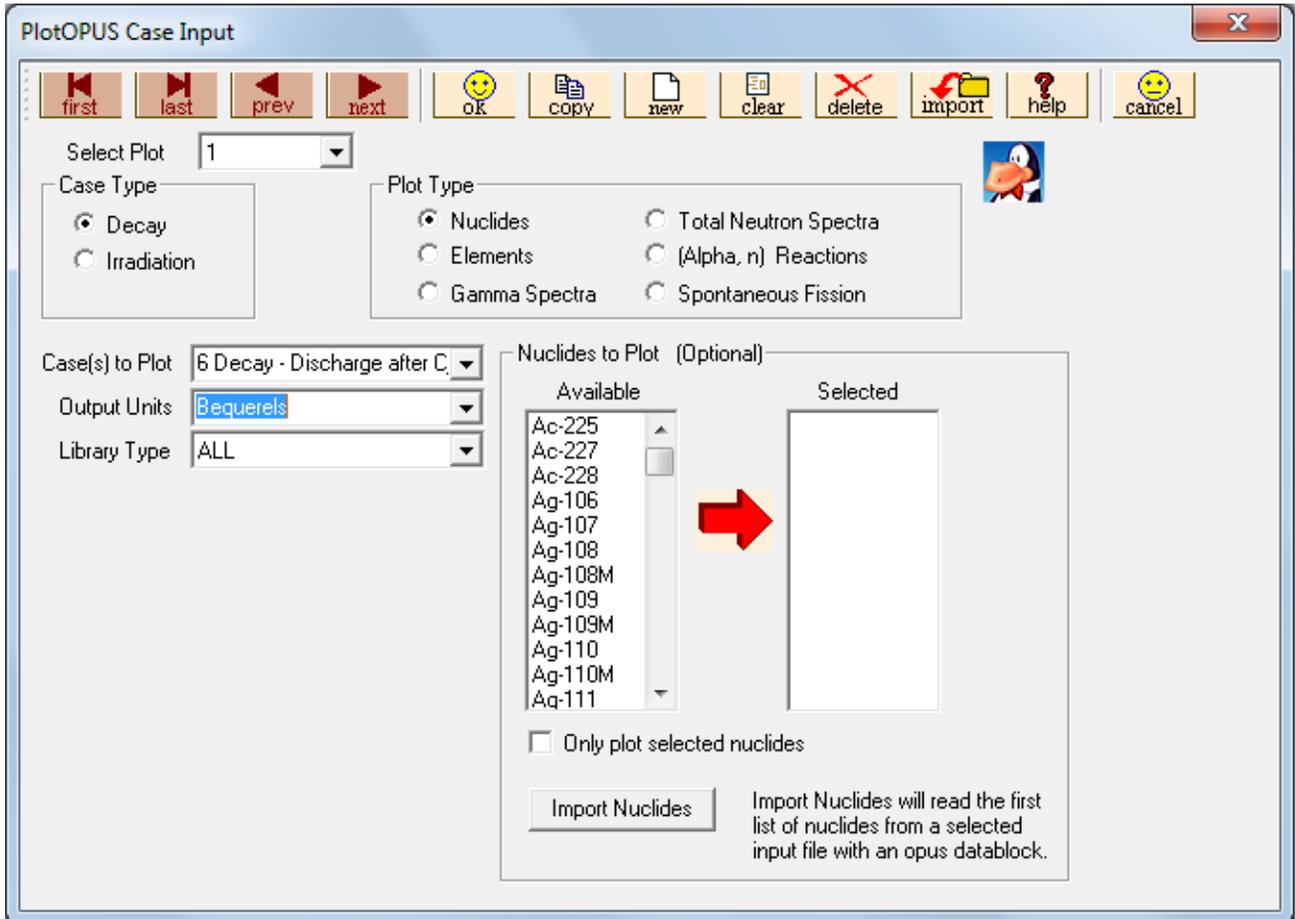

Fig. 45. Final decay case for 5-year discharge with intermediate time steps filled.

9.5 SET UP PLOT

We will generate 3 plots: (1) Radioactivity in Becquerels, (2) Neutron spectra, and (3) Gamma spectra. Click on the **Plot Setup** button. Select the final case 6 Decay as the **Case(s) to Plot**, and set **Output Units** to “Becquerels.” The form should look like Fig. 46.

9.6 EXECUTE SCALE

Execute SCALE by pressing the **Run** button. The **Save As** dialog form will open. Go to the folder where you want to save your input and output files. Enter the file name **sample_problem2** for the **File name**. A DOS window will open and display the progress of the calculation. It is important to watch for SCALE error codes as well as indications that the problem has executed successfully. Note that three SCALE modules are executed (i.e., ARP, ORIGEN, and OPUS). OPUS is called three times, once for each plot that was requested. OPUS extracts the requested plot data from the ORIGEN results.

When the calculation is complete, the DOS window appearance should be similar to Fig. 49. You may close the DOS window once execution is completed.

9.7 VIEW OUTPUT

To view the output results with your default text editor, select the **Output** button. The top of the output file contains information about the version of SCALE and the location of input and output files. This section is followed by echo of input for each SCALE module called, the time and date when called, the completion code (non-zero code indicates an error), and the CPU time used (Fig. 50). At the end of the output file are listings of the plot data by OPUS for the three plots that were requested.

Fig. 50. Beginning of output file for sample problem 2.

9.8 VIEW PLOT

You may view the plot results using the PlotOPUS program by selecting the **Plot** button. The plot displayed will be the first plot requested, radioactivity in Becquerels (Fig. 51). The nuclide list on the right side of the plot lists the primary contributors in order of importance. Note that PlotOPUS plots the data for the first 14 contributors by default. You can click on the nuclide list to select or de-select nuclides to display. The Ctrl and Shift keys can be used in combination with the mouse to select multiple nuclides or a group of nuclides similar to other Windows programs.

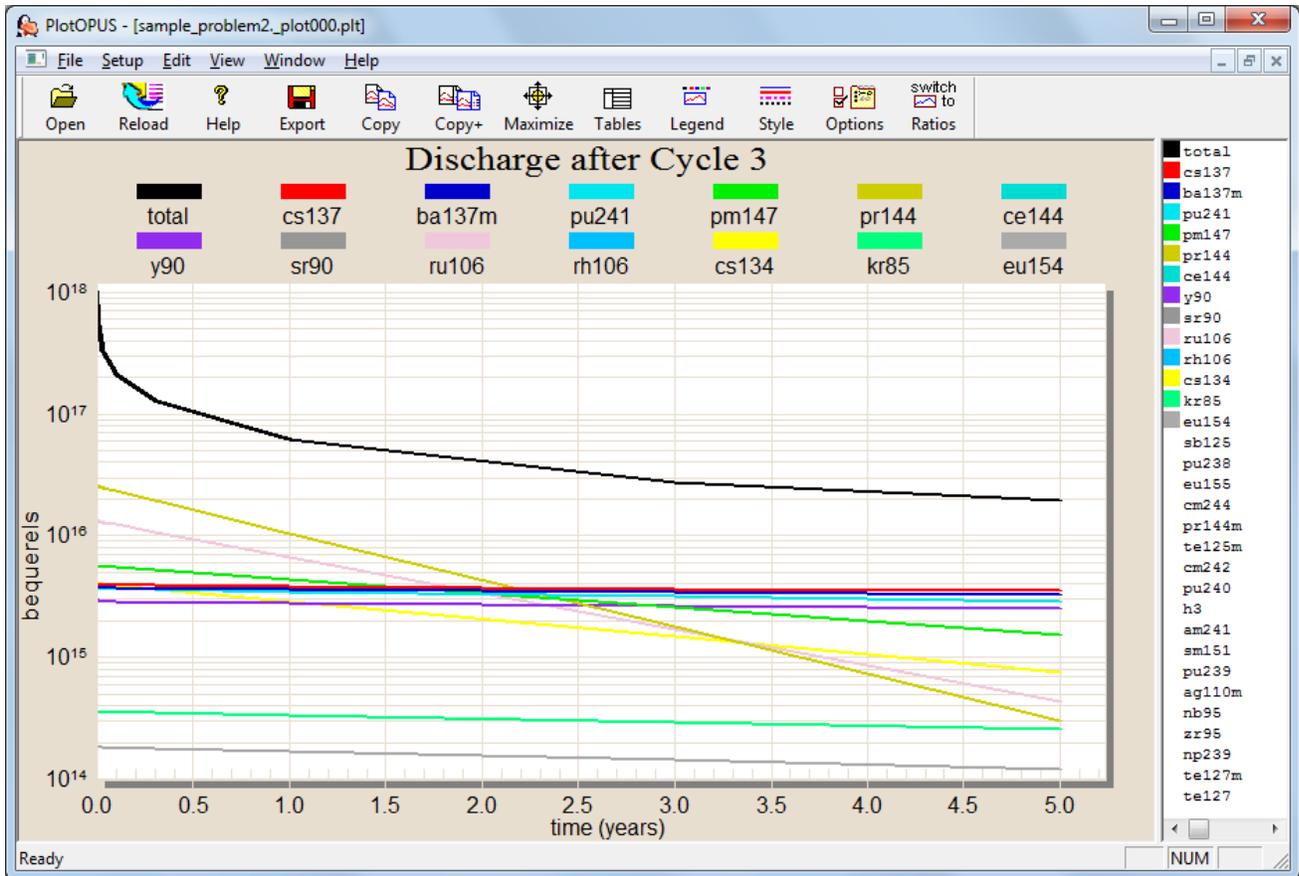

Fig. 51. Plot of radioactivity in Becquerels for sample problem 2.

To view the other plots, click on **Window** in the menu bar at the top of the PlotOPUS window to see a list of all plots generated for the current job. The plot file names are numbered in order of the plots requested in OrigenArp. Select the desired plot to view. The total neutron spectra plot is shown in Fig. 52, and the gamma spectra plot is shown in Fig. 53.

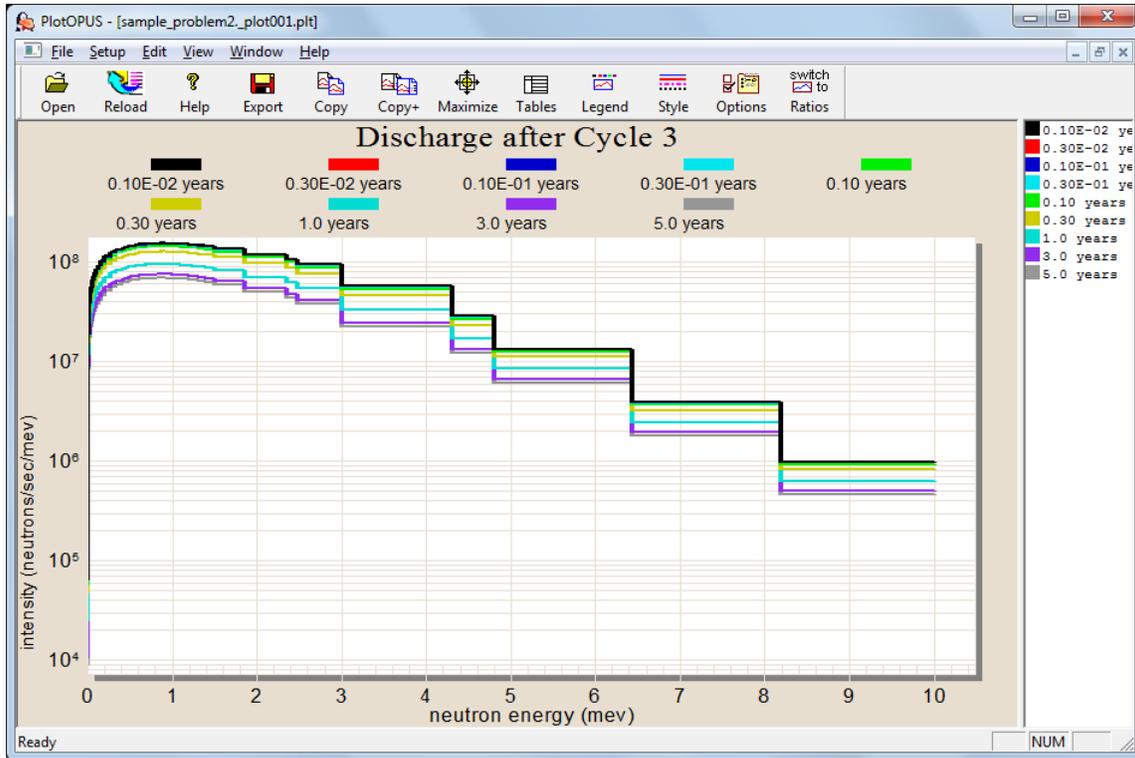

Fig. 52. Total neutron spectra plot for sample problem 2.

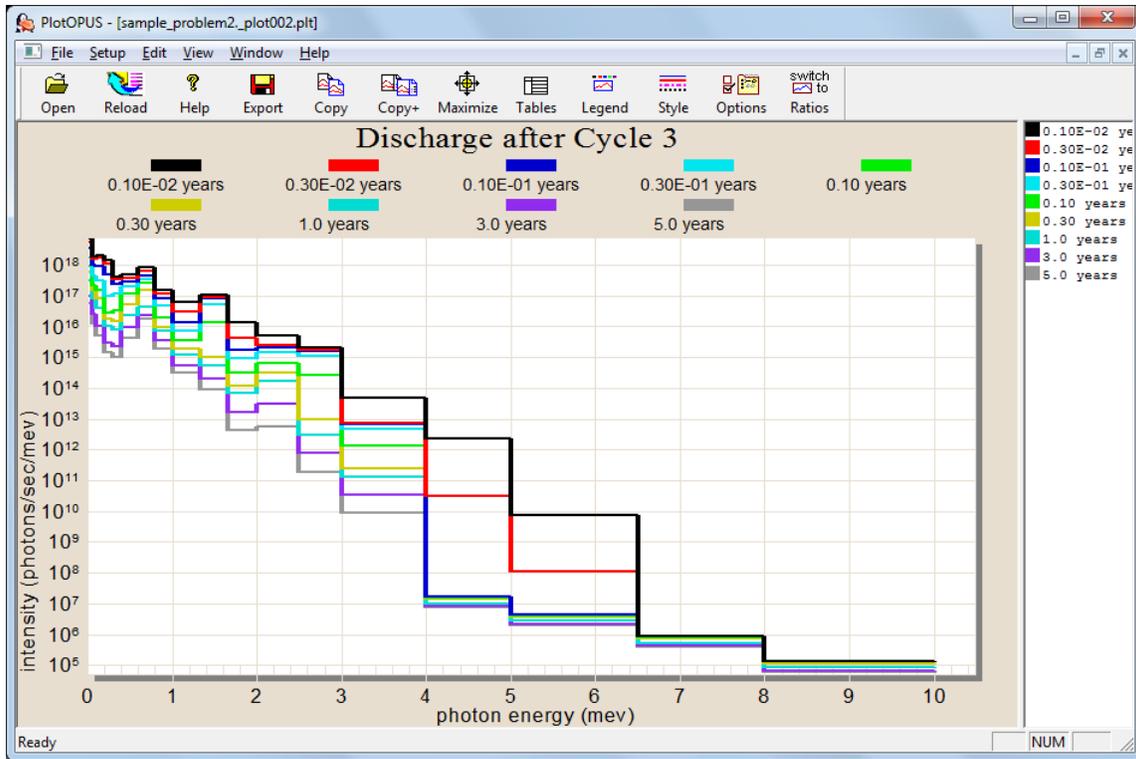

Fig. 53. Gamma spectra plot for sample problem 2.

Press on the **Tables** button to open the plot data tables for the plots in the text editor. The plot data table for the first plot is shown in Fig. 54.

Fig. 54. Plot data table of radioactivity in Becquerels for sample problem 2.

10. SAMPLE PROBLEM 3: DECAY ONLY PROBLEM

For problems that require generating neutron and/or gamma source terms from radioactive material that is not being irradiated in a reactor, only a decay case is required. The material may or may not contain fissile material. In this sample problem, we will calculate the gamma source term from a 0.1 gram ^{60}Co source.

10.1 START IN DETAIL MODE

Start OrigenArp in **Detail** mode. If the **Express** form is displayed at startup, select the **Detail** button. Click the **New** button to clear any data from a previous problem.

10.2 ENTER COMPOSITION DATA

Select the **Comps** (Compositions) button to access the **Composition Data** form. Because there is no irradiation case in this problem, the selection of the **Fuel Type** has no impact on the calculation. The **Fuel Type** designates which cross-section library to use, but cross sections are not used in a decay case. The same decay data are used, regardless of the **Fuel Type** chosen.

For **Element**, select Co and for **Isotope**, select 60. Enter 0.1 for the **Concentration** in **Units** of Grams. The form should look like Fig. 55.

The screenshot shows the OrigenArp software interface with the 'Composition Data' form open. The window title is 'OrigenArp - [Composition Data Co-60.arp]'. The menu bar includes File, Edit, View, Window, Help, and Express. The toolbar contains icons for Options, new, open, save, print, help, run, output, plot, tables, editor, and express. The 'Comps' section is active, showing buttons for Ok, Apply, Reset, Help, Previous, Next, Enrich, Fuel Dist, Del Row, and Cancel. The 'Neutron' section has radio buttons for 'Enter composition data' (selected) and 'Restart from existing data file'. The 'Units' dropdown is set to 'Grams'. The 'Gamma' section has a 'Fuel Type' dropdown set to 'ce14x14'. The 'Cases' section has a 'Moderator Density' input field with the value '0.733200' and units 'g/cc'. The 'Summary' section has a 'Uranium' input field with the value '0' and units 'g'. The 'Plot Setup' section has an 'Enrichment (wt%U235)' input field with the value '0'. The 'Compositions' table is visible, with columns for Element, Isotope, Library, and Concentration. The first row shows Element 'Co', Isotope '60', Library 'Light Element', and Concentration '0.1'. The second row is empty. The status bar at the bottom shows 'Ready' and a 'NUM' button.

Element	Isotope	Library	Concentration
1 Co	60	Light Element	0.1
2			

Fig. 55. Composition data form for ^{60}Co decay problem.

Click **OK**. The warning message “Value is outside the recommended range for enrichment. Do you wish to ignore this limit?” This message is displayed because there is no uranium in the composition data. Click **Yes** to ignore the limit for this case. The limit can be ignored because fuel is not being irradiated in this problem.

10.3 ENTER GAMMA ENERGY GROUPS

Click on the **Gamma** button to open the **Gamma Energy Spectra** form. Select 47GrpSCALE6 for the **Group Structure** (Fig. 56). Click **OK** to close the form.

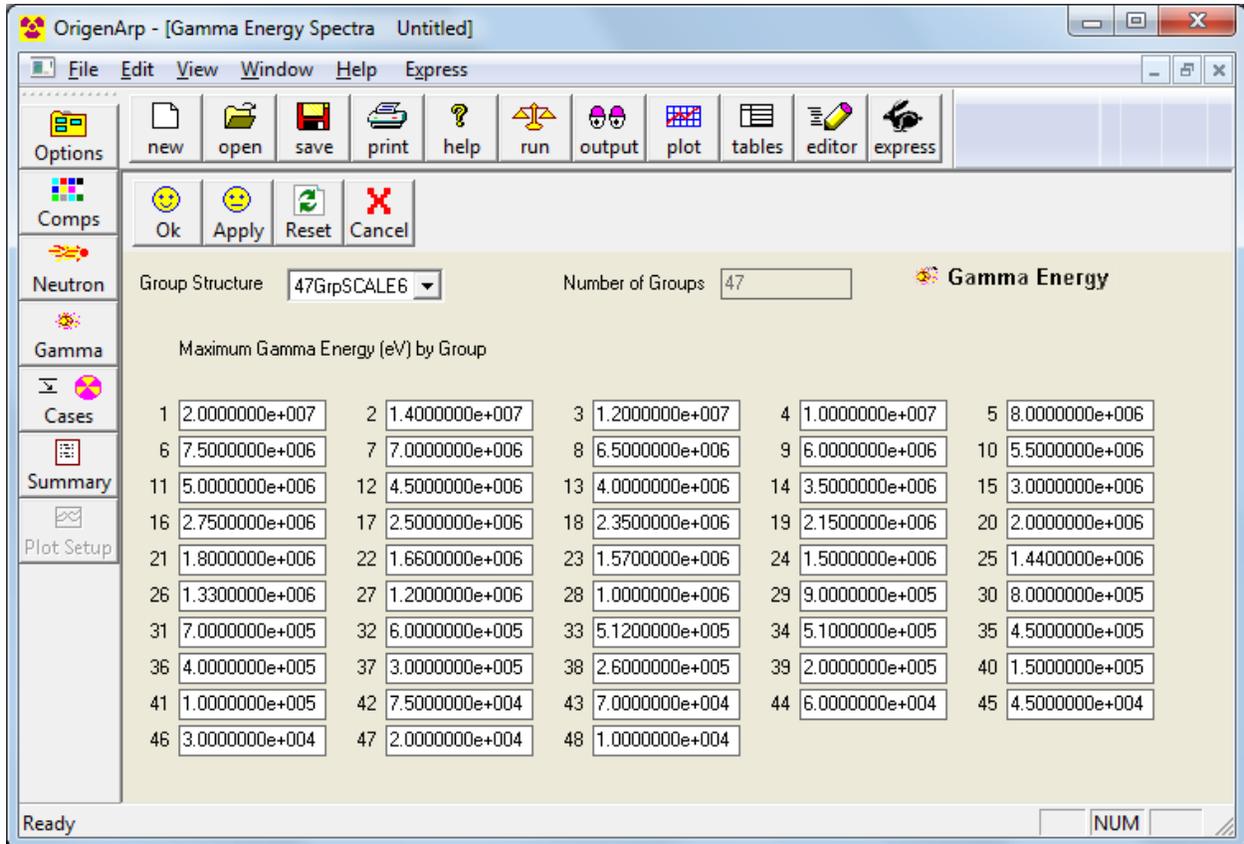

Fig. 56. Gamma energy spectra form for ⁶⁰Co decay problem.

10.4 ENTER CASE DATA

Select the **Cases** button to open the **Case Data** form. Then select the **Decay** button to create a new decay case. Enter Co-60 Decay Case for the **Title**. Because we want an instantaneous source, change the **Time Units** to Seconds and enter 1 for the **Cumulative Time**. Check the **Source Spectra** and **Save Results** boxes. The form should look like Fig. 57. Click **OK** to close form.

The screenshot shows the 'Decay' case form in OrigenArp. The window title is 'OrigenArp - [Decay Case 1 Co-60.arp]'. The menu bar includes File, Edit, View, Window, Help, and Express. The toolbar contains icons for new, open, save, print, help, run, output, plot, tables, editor, and express. Below the toolbar are buttons for Ok, Apply, Reset, Help, Previous, Next, Cancel, Fill, Insert, Delete, Options, and Element.

The main form area is titled 'Decay Case # 1'. It contains the following fields and controls:

- Title: Co-60 Decay Case
- Basis: 0 MTU
- Beginning Time = 0.000000e+000
- Time Units: Seconds
- (Alpha,n): U02
- (Alpha,n) Cutoff: 1e-005
- Alpha Groups: 200
- Bremsstrahlung: U02
- Gamma Library: Total
- Print Neutron Source Calculation Details

Below these fields is a table titled 'Time at which output is desired':

Cumulative Time	Source Spectra	Save Results
1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
	<input type="checkbox"/>	<input type="checkbox"/>
	<input type="checkbox"/>	<input type="checkbox"/>
	<input type="checkbox"/>	<input type="checkbox"/>
	<input type="checkbox"/>	<input type="checkbox"/>
	<input type="checkbox"/>	<input type="checkbox"/>
	<input type="checkbox"/>	<input type="checkbox"/>
	<input type="checkbox"/>	<input type="checkbox"/>
	<input type="checkbox"/>	<input type="checkbox"/>
	<input type="checkbox"/>	<input type="checkbox"/>

The status bar at the bottom shows 'Ready' and 'NUM'.

Fig. 57. Decay case form for ^{60}Co decay problem.

10.5 SET UP PLOT

Select **Plot Setup** button to specify a spectra plot for this problem. Click on **Gamma Spectra** for the **Plot Type**. Select the case 1 Decay as the **Case(s) to Plot**, and set **Output Units** to “Photons/s/mev.” The form should look like Fig. 58. Click **OK** to close the form.

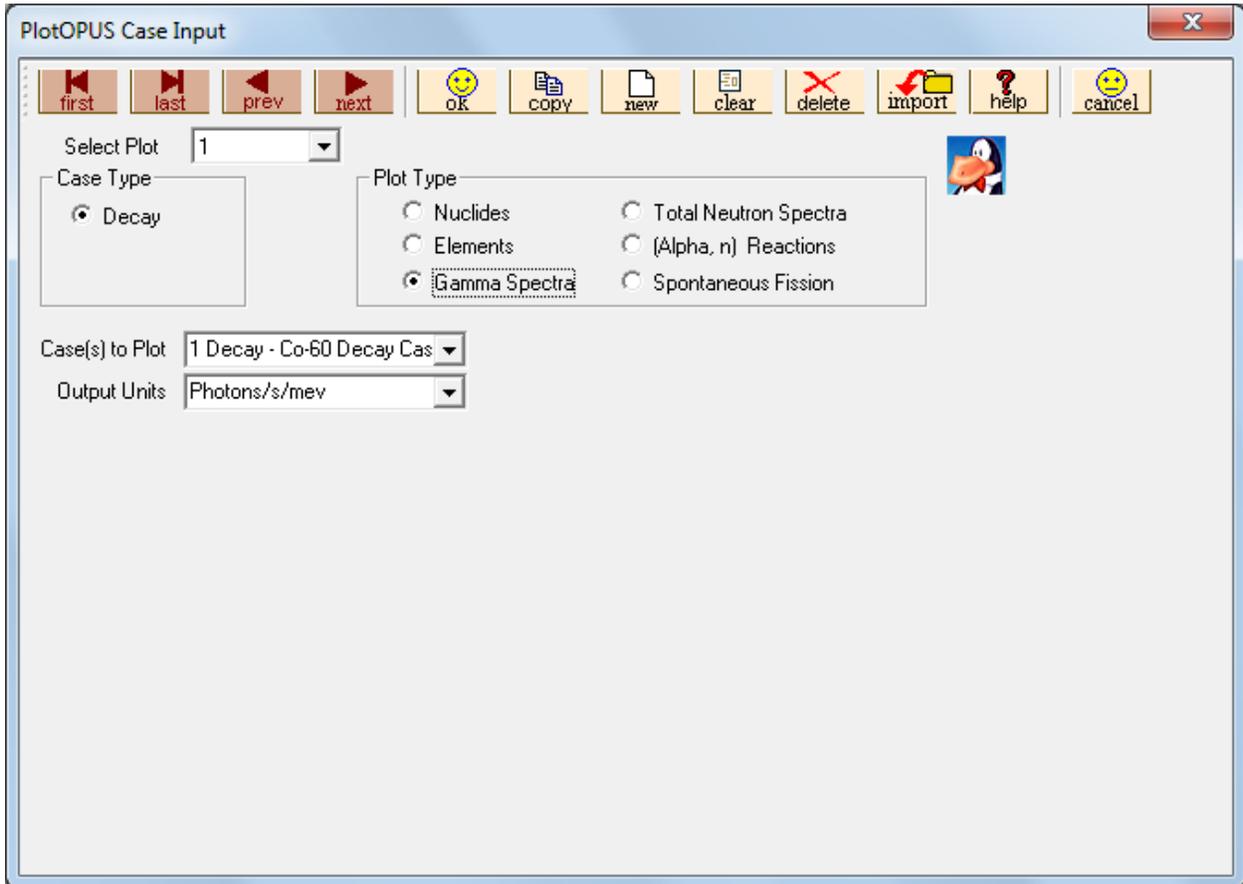

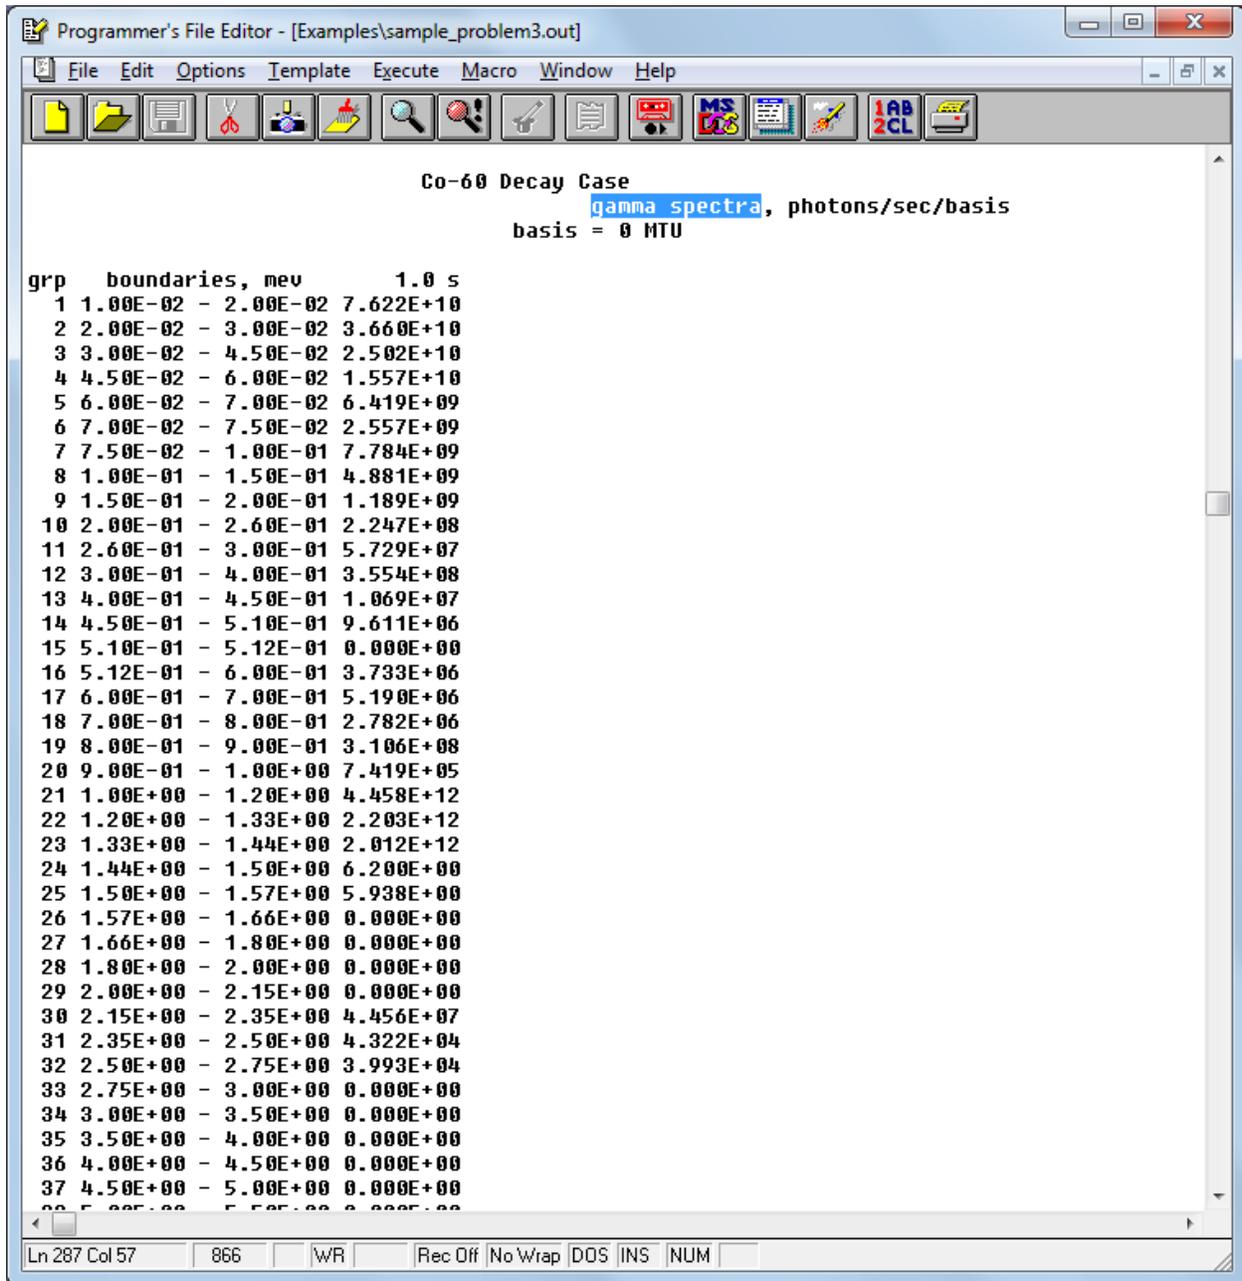

Fig. 58. PlotOPUS case input form for ^{60}Co decay problem.

10.6 EXECUTE SCALE

Execute SCALE by pressing the **Run** button. The **Save As** dialog form will open. Go to the folder where you want to save your input and output files. Enter the file name **sample_problem3** for the **File name**. A DOS window will open and display the progress of the calculation. It is important to watch for SCALE error codes as well as indications that the problem has executed successfully. Note that only the SCALE modules ORIGEN and OPUS were executed. ARP is not called, because no cross-section interpolation is performed for a decay-only problem.

10.7 VIEW OUTPUT

To view the output results with your default text editor, select the **Output** button. Use the Find option in your text editor (click on blue magnifying glass icon in PFE) to search for the phrase “gamma spectra.” The output displayed should look like Fig. 59. The listing gives the gamma spectra by energy group with the energy boundaries for each group. After group 47, the total source is listed as 8.851E+12 photons/s (not shown in Fig. 59).

Fig. 59. Gamma spectra in output file for sample problem 3.

10.8 VIEW PLOT

You may view the plot results using the PlotOPUS program by selecting the **Plot** button. The gamma spectra plot displayed should look like Fig. 60.

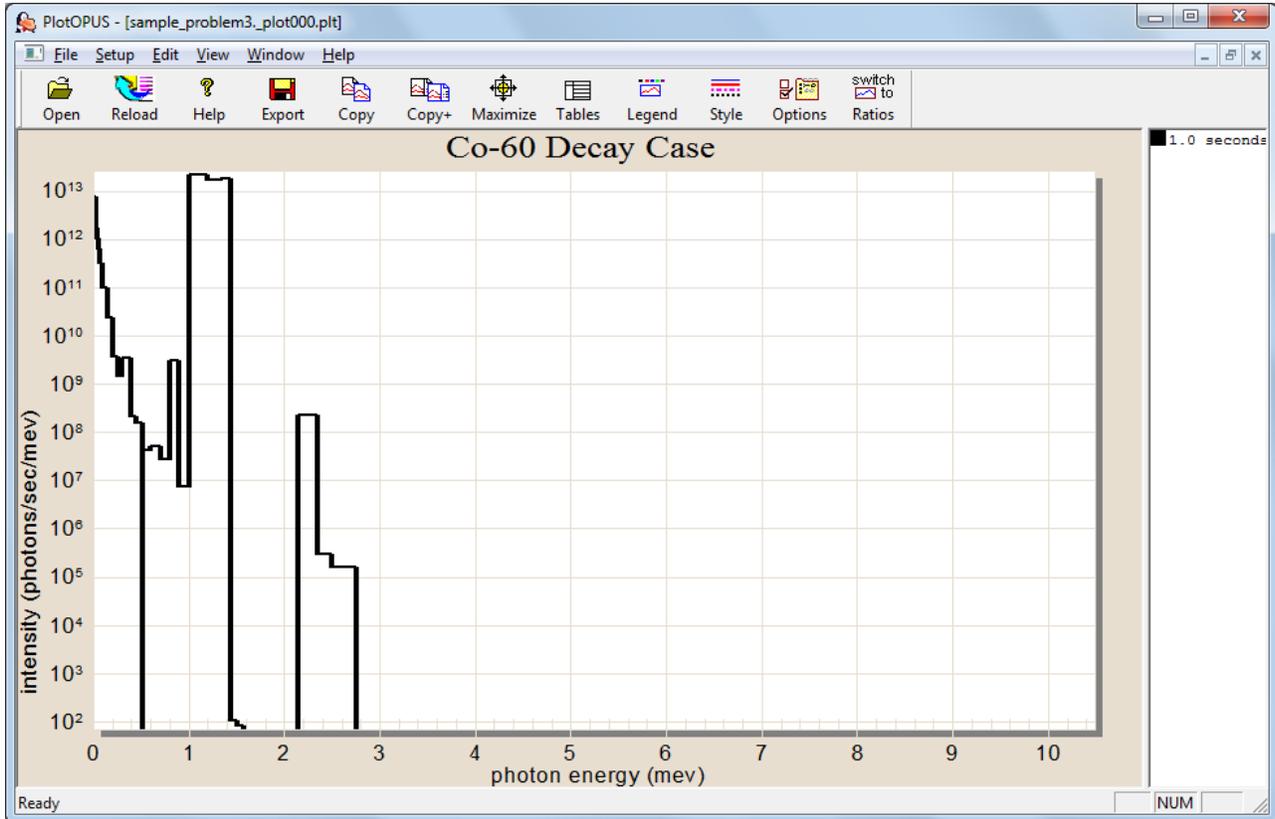

Fig. 60. Plot of ^{60}Co gamma spectra for sample problem 3.

11. PLOTTING RESULTS

The following steps may be used to plot results from an OrigenArp run.

1. Create an OrigenArp problem or open an existing problem.
2. Ensure that the **Save Results** boxes are checked for the times steps in the case data for the case(s) to be plotted.
3. Use **Plot Setup** to specify desired plot(s).
4. Execute SCALE.
5. Upon successful completion, select **Plot** button to start the PlotOPUS program and display your plotted results.
6. Click on the **Tables** button in OrigenArp or PlotOPUS to open the table of plot data in the text editor.

The **Plot Setup** toolbar button presents the **PlotOPUS Case Input** form (Fig. 61). The same form is used whether OrigenArp is in Express mode or Detail mode. The list of available output units is dependent on the selected **Case Type** and **Plot Type**. Therefore, you should first select these options prior to selecting the **Output Units**.

Fig. 61. PlotOPUS case input form.

11.1 PlotOPUS

Upon successful completion of a SCALE job with plot data specified, you may view your results by selecting the **Plot** button on the top toolbar. Alternatively, you may view the plot files executing

PlotOPUS from its shortcut in the SCALE start menu folder. The plot files generated have a “.plt” extension. The plot filename generated from OrigenArp is constructed by appending “_plot###.plt” to the filename for the related case. The “###” symbols represent a plot number, beginning with “000.”

For example, if you are generating plots from a case named “test,” the input to SCALE will be stored in “test.inp,” an OrigenArp binary representation will be stored in “test.arp,” and plot data for two plots would be stored in “test._plot000.plt” and “test._plot001.plt.” Note that this file name syntax may vary slightly between different SCALE versions.

If the SCALE job does not execute successfully, no plot files will be created.

12. IMPORTING ORIGEN-ARP INPUT FILES

The OrigenArp **Import** command is used to “import” an existing ORIGEN-ARP input file in text format (.inp file) to populate data for the OrigenArp Detail forms. The Import option can be used to import files created with earlier versions of OrigenArp or input files created by other means (i.e., no .arp file exists). Only those ORIGEN options available in OrigenArp are allowed in the input file. If the input file includes ORIGEN options that are not compatible with OrigenArp, import may fail.

To execute the **Import** command, select **Import** under the **File** menu or use the shortcut key Ctrl+R. Once activated, a file dialog is presented, allowing you to select the file to be imported.

13. REQUIRED DATA SETS

The following data sets are needed by OrigenArp and are installed with SCALE.

- ARPDATA.TXT
- OR_ARP_GroupLibOptions.dat
- OR_ARP_NeutronGroups.dat
- OR_ARP_GammaGroups.dat
- OR_ARP_nuclides.dat
- a.bat
- OrigenArpHelp.chm

13.1 ARPDATA.TXT

The file named ARPDATA.TXT contains the input describing the pregenerated cross section library types available for ARP to use. For each reactor or fuel type there are corresponding entries that provide the filenames of the associated data libraries, the enrichment range, and the burnup range. For more information on ARPDATA.TXT, refer to the [SCALE Manual Sect. D1.A.2].

The file named ARPDATA.TXT is read by ARP during the execution of SCALE. It is also read by OrigenArp. OrigenArp reads ARPDATA.TXT from the SCALE data folder (e.g., \scale6\data).

13.2 OR_ARP_GroupLibOptions.dat

The energy group structures that are available to OrigenArp are defined in this file. New group structures that you create can be used by OrigenArp if a record is added in this file. The added record should include the number of groups and the name of the group structure, separated by one or more spaces. The neutron group structures are listed following the entry “//neutron” and the gamma group structures are listed following the entry “//gamma.” The actual energy groups for the structure must be specified in OR_ARP_NeutronGroups.dat or OR_ARP_GammaGroups.dat. This data file is located in the OrigenArpUI folder in the SCALE data folder (e.g., \scale6\data\OrigenArpUI).

13.3 OR_ARP_NeutronGroups.dat

The neutron energy group structures listed in OR_ARP_GroupLibOptions.dat are specified in this file. This data file is also located in the OrigenArpUI folder in the SCALE data folder (e.g., \scale6\data\OrigenArpUI).

The format for this file requires that the group structure name be listed on one record followed by the energy group bounds from upper bound to lower bound on subsequent records in free format. The number of energy group boundaries must be one greater than the number of groups. This pattern is repeated for each group structure available.

13.4 OR_ARP_GammaGroups.dat

The gamma energy group structures listed in OR_ARP_GroupLibOptions.dat are specified in this file. This data file is also located in the OrigenArpUI folder in the SCALE data folder (e.g., \scale6\data\OrigenArpUI).

The format for this file requires that the group structure name be listed on one record followed by the energy group bounds from upper bound to lower bound on subsequent records in free format. This pattern is repeated for each group structure available.

13.5 OR_ARP_nuclides.dat

OR_ARP_nuclides.dat contains information about each isotope that is available in OrigenArp. This data set should not be modified by the user. This data file is also located in the OrigenArpUI folder in the SCALE data folder (e.g., \scale6\data\OrigenArpUI).

13.6 a.bat

When the **run** button is pressed, OrigenArp constructs the arguments to this file and calls it to execute SCALE in DOS mode. It is recommended that you do not modify this file. OrigenArp requires that this file be in the same directory as the OrigenArp executable (e.g., \scale6\OrigenArp).

13.7 OrigenArpHelp.chm

OrigenArpHelp.chm is the compiled HTML help file that contains all the help information included in the OrigenArp help files. OrigenArp requires that this file be in the same directory as the OrigenArp executable (e.g., \scale6\OrigenArp).

14. HOW TO ADD NEW NEUTRON AND GAMMA ENERGY GROUP STRUCTURES

The neutron and gamma energy group structures are used by ORIGEN to create the multigroup source spectra from the continuous and/or discrete line emission data. Any energy group structure may be used. If you create a new energy group structure for neutron or gamma sources, it can be applied in OrigenArp as a new group structure option by adding a line in the file OR_ARP_GroupLibOptions.dat.

The new line should be inserted under “//neutron” for neutron groups or under “//gamma” for gamma groups. The line should include the number of groups and the name of the group structure separated by one or more blanks. For example, to add a 25-group gamma group structure named 25GrpSpecial, the OR_ARP_GroupLibOptions.dat file would be modified as shown below (changes are shown in blue):

```
//neutron
27 27GrpSCALE6
44 44GrpENDF5
47 47GrpBUGLE
200 200GrpSCALE6
238 238GrpSCALE
//gamma
18 18GrpSCALE5
18 18GrpORIGEN2
20 20GrpBUGLE
47 47GrpSCALE6
25 25GrpSpecial
```

The actual energy groups must be specified in OR_ARP_NeutronGroups.dat or OR_ARP_GammaGroups.dat. The format for these files requires that the name of each energy group structure appear on one line followed by the energy group boundaries from upper bound to lower bound in free format on following lines. The number of energy group boundaries must be one greater than the number of groups. OrigenArp requires the user to input the maximum-energy cutoff in electron volts (eV) for each group, beginning with group 1 (the highest-energy group). The field following the maximum-energy cutoff for the lowest-energy group must contain the minimum-energy cutoff for that group. For example, to add a 25-group structure named “25GrpSpecial” for gammas, the OR_ARP_GammaGroups.dat file would be modified as shown below (changes are shown in blue):

```
18GrpSCALE5
 1.E+7      8.E+6      6.5E+6      5.E+6      4.E+6

15. ADVANCED FEATURES

15.1 EXECUTE AN EXTERNALLY MODIFIED INPUT FILE

There may be occasions when you want to use a text editor to modify the input file created by OrigenArp and then execute this modified file using SCALE from within OrigenArp. This can be useful to select special options that are available in ORIGEN but are not currently supported by OrigenArp.

A SCALE input file (.inp) created by OrigenArp may be manually modified by selecting the **Editor** button to open the file in a text editor. If it is modified and saved in the text editor, OrigenArp will recognize that the file has been modified when you attempt to run it using the **Run** button. A warning dialog such as Fig. 62 will appear on the screen. If you select **Yes**, OrigenArp will run the modified .inp file. If you select **No**, OrigenArp will regenerate the .inp input file from the .arp binary file last saved by OrigenArp, overwriting any modifications that you made in the text editor. If you select **Cancel**, no action is taken.

Alternatively, you may select **Execute SCALE w/o Saving** under the **File** menu to execute the modified .inp file. This action is the same as selecting Yes in the warning dialog.

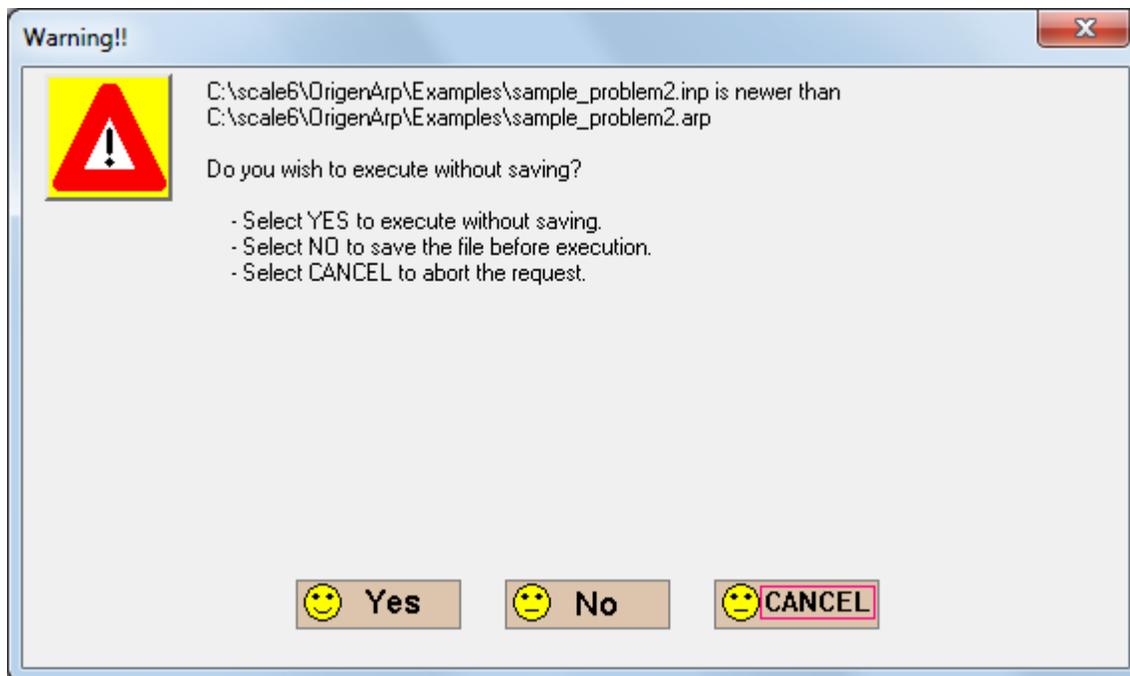

Fig. 62. Modified input file warning dialog.

15.2 SETTING URANIUM ENRICHMENT FRACTIONS

If the user inputs enrichment, then the initial uranium isotopic vector is determined using built in isotopic ratios for U-234 and U-236 shown below.

$$\text{wt \% U-234} = 0.0089 * \text{wt \% U-235}$$

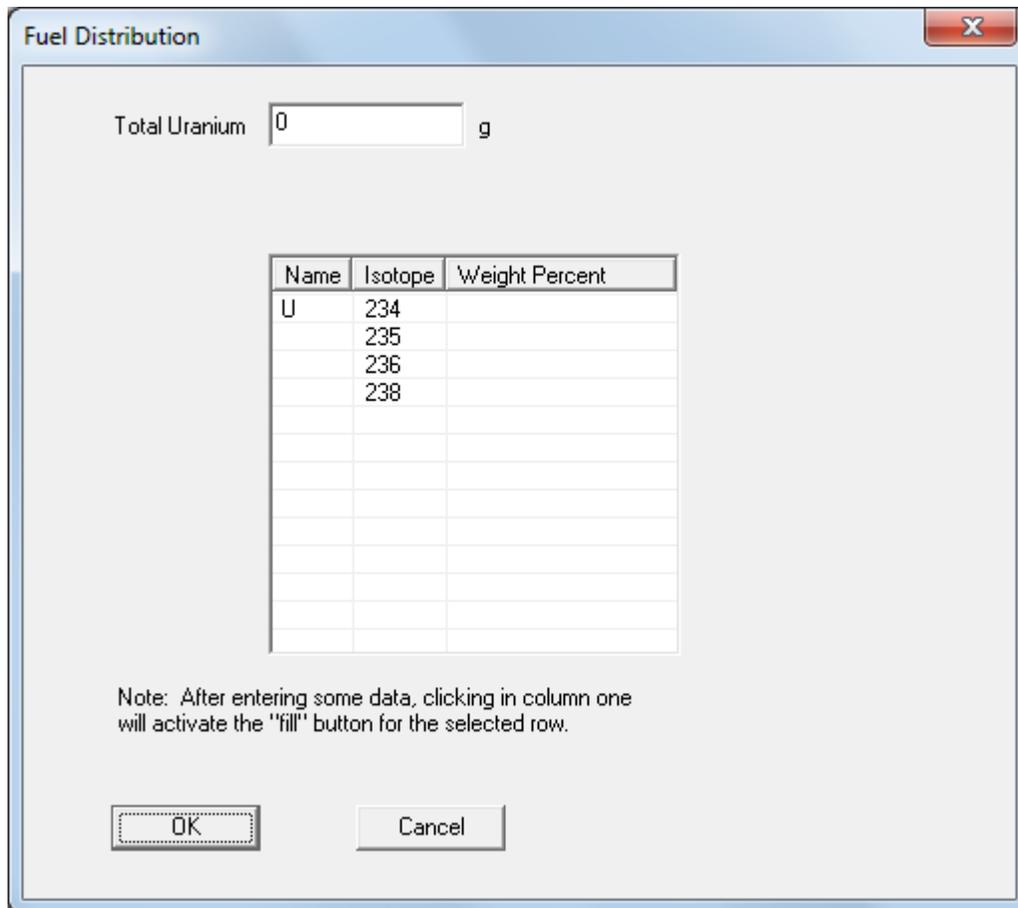

$$\text{wt \% U-236} = 0.0046 * \text{wt \% U-235}$$

wt % U-235 = enrichment (wt % U-235)

wt % U-238 = 100 – wt % U-234 – wt % U-235 – wt % U-236

The default enrichment factors were taken from O.W. Hermann et al., *Technical Support for a Proposed Decay Heat Guide Using SAS2H/ORIGEN Data*, NUREG/CR-5625 (ORNL-6698), Martin Marietta Energy Systems, Inc., Oak Ridge National Laboratory, September 1994, and are based on a review of historical enrichment data.

The isotopic ratio factors for U-234 (i.e., 0.0089) and U-236 (i.e., 0.0046) can be modified by the user. To modify these factors, select **Edit Enrichment Fractions** under the **Edit** menu. The modified values are saved in the OrigenArp initialization file on exit from OrigenArp. The default values can be restored if the user selects the **Reset Defaults** button in Default Settings (opened via the **Options** button). The user can override these factors for an individual case by clicking the **Fuel Dist** button on the **Composition Data** form toolbar to open the **Fuel Distribution** form (Fig. 63).

Total Uranium g

Name	Isotope	Weight Percent
U	234	
	235	
	236	
	238	

Note: After entering some data, clicking in column one will activate the "fill" button for the selected row.

Fig. 63. Fuel distribution form.

15.3 ACCELERATOR KEYS

Table 2 shows keyboard accelerator keys. Most of these shortcuts require that related views or windows be active and/or in focus.

Table 2. Keyboard accelerator keys

Key	Operation
Ctrl + C	Copy highlighted item to clipboard
Ctrl + D	Delete row in Compositions or Case Data
Alt + E	Edit Enrichment Fractions
Ctrl + E	Edit input file with external editor
Alt + F	Change font in Summary View
Ctrl + I	Insert row in Case Data
Ctrl + N	New file
Alt + O	Enter plot setup
Ctrl + O	Open file
Alt + P	Execute PlotOPUS
Ctrl + P	Print summary view
Ctrl + R	Import file
Alt + S	Setup options
Ctrl + S	Save file
Ctrl + Alt + T	Run SCALE, saving temporary files in SCALE default temporary directory
Alt + U	Update Express (retain compositions)
Ctrl + V	Paste from clipboard into edit box
Ctrl + W	Close form currently in focus
Ctrl + X	Cut highlighted item in edit box to clipboard

16. TROUBLESHOOTING

16.1 MISSING DATA

When you first execute OrigenArp, it verifies the existence of the required data sets. An error message stating that one of the required data sets is missing means that OrigenArp did not find the indicated data set in the expected location where it should have been installed with SCALE. Please make sure that all of the required data sets are available and in the appropriate directory. You may need to reinstall SCALE.

16.2 RUNNING OrigenArp OR PlotOPUS WITH FOREIGN LANGUAGE VERSIONS OF WINDOWS

Please refer to the SCALE Getting Started file or the SCALE Notebook for information on running with a foreign language version of Windows.

16.3 TECHNICAL SUPPORT

For technical support, address your e-mail to scalehelp@ornl.gov or visit the SCALE website at <http://www.ornl.gov/scale> where you can find answers to commonly asked questions in the SCALE Notebook and the OrigenArp Notebook.
