Data Compilation for AGR-1 Variant 1 Coated Particle Composite LEU01-47T

J. D. Hunn and R. A. Lowden
Oak Ridge National Laboratory

This document is a compilation of characterization data for the AGR-1 variant 1 coated particle composite LEU01-47T, a composite of three batches of TRISO-coated 350 μm 19.7% low enrichment uranium oxide/uranium carbide kernels (LEUCO). The AGR-1 TRISO-coated particles consist of a spherical kernel coated with a ~50% dense carbon buffer layer (100 μm nominal thickness) followed by a dense inner pyrocarbon layer (40 μm nominal thickness) followed by a SiC layer (35 μm nominal thickness) followed by another dense outer pyrocarbon layer (40 μm nominal thickness). The coated particles were produced by ORNL for the Advanced Gas Reactor Fuel Development and Qualification (AGR) program to be put into compacts for insertion in the first irradiation test capsule, AGR-1. The kernels were obtained from BWXT and identified as composite G73D-20-69302. The BWXT kernel lot G73D-20-69302 was riffled into sublots for characterization and coating by ORNL and identified as LEU01-## (where ## is a series of integers beginning with 01).

The AGR-1 variant 1 coated particles were similar to the AGR-1 baseline coated particles with the exception that the inner pyrocarbon (IPyC) coating was deposited at ~25°C higher temperature. A data compilation for the AGR-1 baseline coated particle composite LEU01-46T can be found in ORNL/TM-2006/019.

Additional particle batches were coated with only buffer or buffer plus inner pyrocarbon (IPyC) layers using similar process conditions as used for the full TRISO batches comprising the LEU01-47T composite. These batches were fabricated in order to qualify that the process conditions used for buffer would produce acceptable densities as described in sections 8 and to measure the IPyC density as described in section 9. The buffer qualification batches were the same as used to qualify the baseline buffer conditions and used 350 μm natural uranium oxide/uranium carbide kernels (NUCO). The NUCO kernels were obtained from BWXT and were identified as composite G73B-NU-69300. The use of NUCO surrogate kernels is not expected to significantly effect the density of the buffer coating. A confirmatory buffer-only batch using LEUCO kernels from G73D-20-69302 was coated and characterized to verify this assumption. The IPyC qualification batches used LEUCO kernels from G73D-20-69302.

The AGR-1 Fuel Product Specification and Characterization Guidance (INL EDF-4380, Rev. 6) provides the requirements necessary for acceptance of the fuel manufactured for the AGR-1 irradiation test. Sections 5.2 and 5.3 of EDF-4380 provide the property requirements for the coated particle batches and coated particle composite. The Statistical Sampling Plan for AGR Fuel Materials (INL EDF-4542, Rev. 6) provides additional guidance regarding statistical methods for product acceptance and recommended sample sizes. The procedures for characterizing and qualifying the particles are outlined in ORNL product inspection plans: AGR-CHAR-PIP-01, AGR-CHAR-PIP-02, AGR-CHAR-PIP-03, and AGR-CHAR-PIP-04. The inspection report forms generated by these product inspection plans document the product acceptance for the property requirements listed in sections 5.2 and 5.3 of EDF-4380.

1 Summary of acceptance test results for LEU01-47T

This section contains all the inspection report forms (IRF) associated with the coated particle composite LEU01-47T. These inspection report forms summarize the acceptance testing performed according to the product inspection plans: AGR-CHAR-PIP-02, AGR-CHAR-PIP-03, and AGR-CHAR-PIP-04. The information in these forms covers all the property specifications listed in sections 5.2 and 5.3 of the AGR-1 Fuel Product Specification and Characterization Guidance document INL EDF-4380, Rev. 6. The coated particle composite, LEU01-47T, was found to meet all the requirements in these two sections of EDF-4380 with the exception of the IPyC density. The IPyC coatings for variant 1 were deposited at $\sim 25^{\circ}\text{C}$ higher temperature than was used to deposit the IPyC coatings for the baseline fuel particles, and are not required to meet the baseline IPyC density specification in section 5.3 of EDF-4380. The expected IPyC density according to section 3.2 of EDF-4380 was $\sim 1.85 \text{ g/cc}$.

These inspection report forms also appear in later sections of this compilation, accompanied by the associated data report forms showing the results of each individual measurement.

Table 1-1 is provided for quick reference. It gives the mean values of key properties of the coated particle composite, LEU01-47T. For standard deviations of the distribution of the measured values see the appropriate IRF. For discussions on the uncertainty in these values, see the associated data acquisition methods and data report forms. The kernel diameter and density values are from ORNL measurements made for information only. The buffer and IPyC densities in the table are averages of the means for the individual interrupted batches (including buffer confirmation batch on LEUCO), rather than direct measurements on the composite. The OPyC density in the table is an average of the mean OPyC density for each batch weighted by the fraction of each batch in the composite.

Table 1-1: Quick reference table for key variable properties of LEU01-47T.

Property	Mean
Average kernel diameter (μm)	349.7
Kernel envelope density (Mg/m^3)	10.924
Average buffer thickness (μm)	102.5
Average IPyC thickness (μm)	40.5
Average SiC thickness (μm)	35.7
Average OPyC thickness (μm)	41.1
Buffer envelope density (Mg/m^3) (interrupted batches)	1.10
IPyC sink/float density (Mg/m^3) (interrupted batches)	1.853
SiC sink/float density (Mg/m^3)	3.2060
OPyC sink/float density (Mg/m^3) (weighted average)	1.898
IPyC anisotropy (BAFo equivalent)	1.014
OPyC anisotropy (BAFo equivalent)	1.013

Table 1-2 is also provided for quick reference. It gives the upper limit of the 95% confidence interval of the defect fraction for key attribute properties of the coated particle composite, LEU01-47T. In other words, these values are the lowest tolerance limits for which the composite would be deemed acceptable at 95% confidence based on the particular sample that was measured. For the actual number of trials and number of failures observed, see the inspection report form for the coated particle composite.

Table 1-2: Quick reference table for key attribute properties of LEU01-47T.

Property	Defect Fraction
Particles with SiC gold spot defects	$\leq 8.2 \times 10^{-4}$
Particle aspect ratio	$\leq 1.7 \times 10^{-3}$
Particles with burn-leach defects	$\leq 4.0 \times 10^{-5}$
Particles with missing OPyC	$\leq 9.7 \times 10^{-5}$

Inspection Report Form IRF-02A: Interrupted Coating Batches - Buffer Density

Procedure:	AGR-CHAR-PIP-02 Rev. 4
Batch 1 ID:	NUCO350-25B
Batch 1 description:	Buffer-coated BWXT kernel composite 69300
Batch 2 ID:	NUCO350-36B
Batch 2 description:	Buffer-coated BWXT kernel composite 69300
Batch 3 ID:	NUCO350-54B
Batch 3 description:	Buffer-coated BWXT kernel composite 69300

Property	Measured Data				Specification INL EDF-4380 Rev. 6	Acceptance Criteria	Acceptance Test Value	Pass or fail	Data Records
	Mean (x)	Std. Dev. (s)	# measured (n)	t value (t)					
Batch 1: Buffer envelope density (Mg/m ³)	1.08	0.04	5	2.132	mean 1.03 ± 0.15	A = x - ts/√n ≥ 0.88 B = x + ts/√n ≤ 1.18	1.04 1.12	pass pass	DRF-16 DRF-22
Batch 2: Buffer envelope density (Mg/m ³)	1.11	0.05	5	2.132	mean 1.03 ± 0.15	A = x - ts/√n ≥ 0.88 B = x + ts/√n ≤ 1.18	1.06 1.16	pass pass	DRF-16 DRF-22
Batch 3: Buffer envelope density (Mg/m ³)	1.11	0.04	5	2.132	mean 1.03 ± 0.15	A = x - ts/√n ≥ 0.88 B = x + ts/√n ≤ 1.18	1.07 1.15	pass pass	DRF-16 DRF-22

Comments

Standard deviations are √5 times the uncertainties in buffer density (standard errors) reported on DRF-16.
 Average thickness of buffer was 108 µm based on average envelope volume of 9.25E-5 cc (effective diameter of 561 µm) and average kernel diameter of 345 µm.
 Average thickness of buffer was 108 µm based on average outer diameter of 561 µm obtained per DAM-10 and average kernel diameter of 345 µm.
 Confirmatory batch on LEUCO kernels, LEU01-16E: mean buffer density = 1.10 g/cc.

3 Coating process conditions

The following pages contain coating process conditions for all coated particle batches associated with the LEU01-47T coated particle composite. The AGR-1 variant 1 fuel particles are similar to the AGR-1 baseline fuel particles with the exception that the inner pyrocarbon (IPyC) coating was deposited at ~25°C higher temperature. These particles were coated within the variant 1 process conditions listed in sections 3.1 and 3.2 of the AGR-1 Fuel Product Specification and Characterization Guidance document INL EDF-4380, Rev. 6.

4 Classification of coated particles

Fully-coated batches of particles were sorted employing a sizing technique described in AGR-ROLLER-SOP-1, Rev. 0 and a tabling method described in AGR-TABLET-SOP-1, Rev. 1 as required in section 5.1 of the AGR-1 Fuel Product Specification and Characterization Guidance document INL EDF-4380, Rev. 6. The purpose of this classification is to remove aspherical particles and particles outside a specified diameter range. Details regarding the application of the procedures to the classification of coated particle batches can be found in the logbooks referenced on the summary sheets.

Particles can be sized using a set of sieves, with diameter ranges and limits determined by the selected mesh openings. As an alternative to sieving, the roller technique uses rotating sloped rollers with a diverging gap to size classify particles. Particles are fed onto the gap between the rollers. The rollers are tilted or angled downward away from the feed point to create an inclined track. The rollers rotate with an upward and outward motion. A particle travels down the gradually widening gap until it reaches a point equal to its diameter upon which it drops through the gap into a collection bin. The gap between the rollers is adjusted to separate different sizes of particles or to classify particles within a specific range of diameters. A schematic illustrating the relationship between roller gap and particle size is shown in Figure 4.1.

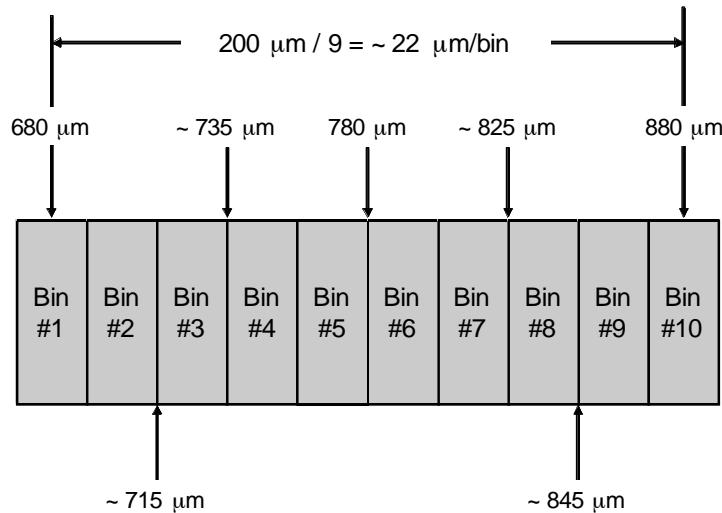

Figure 4.1. Schematic of the collection bins and roller spacing showing relationship between roller gap and particle size.

From EDF-4380, Rev 6, section 5.1.1, Sieving or Rolling to Remove Undersize and Oversize Particles, “Each batch of coated particles shall be double-sieved with electroformed sieves to remove all particles that pass through a 700 µm sieve and all particles that do not pass through an

850 μm sieve. . . . Alternately, the particles can be size-classified using a roller micrometer that achieves results equivalent to or better than sieving." To size separate the batches of coated particles, the gaps between the rollers above bins #1 and #10 were set at 680 and 880 μm , respectively, producing the size distribution shown in the figure. Only particles from Bins #3 - #8, with a particle size range of 715 to 845 μm , were retained with the majority of the particles being from Bins #4 through #7 with a nominal particle size range 735 to 825 μm .

The following pages contain records of the classification performed on the TRISO-coated particle batches associated with the LEU01-47T coated particle composite.

5 Blend of coated particle composites

Three batches of TRISO-coated particles were blended into composite LEU01-47T. The mass of each batch added to the composite is shown in the following table.

Batch ID	Amount added to LEU01-47T composite (g)
LEU01-43T	153.1087
LEU01-44T	149.2793
LEU01-29T	153.6930
Total	456.0810

Three batches of buffer-coated particles were blended into composite NUCO350-58B. The mass of each batch added to the composite is shown in the following table.

Batch ID	Amount added to NUCO350-58B composite (g)
NUCO350-25B	54.4356
NUCO350-36B	55.8622
NUCO350-54B	56.0934
Total	166.3912

6 Characterization of LEUCO kernel composite

This section contains data on the kernel composite used for LEU01-47T. The data was obtained according to product inspection plan AGR-CHAR-PIP-01R1. Some of the kernel data in this section was used as input for subsequent measurements of coating properties (e.g., buffer density and burn-leach defects). This is only a partial analysis of the kernel composite and was not used for product acceptance. Characterization of the kernel composite for acceptance according to the specific requirements listed in section 4 of INL EDF-4380 is documented in the BWXT data package for G73D-20-69302. The BWXT kernel lot G73D-20-69302 was riffled into sublots for characterization and coating by ORNL and identified as LEU01-## (where ## is a series of integers beginning with 01).

Note that the average kernel weights were remeasured using a revised procedure which improved the accuracy of the reported value by improving the randomness of the measured samples. The measured value of the LEUCO average kernel weight changed from $(2.47 \pm 0.01) \cdot 10^4$ grams per kernel to $(2.418 \pm 0.006) \cdot 10^4$ grams per kernel. On data report form DRF-15 for the measurement of average kernel envelope density, the average kernel weight is used to approximate the number of kernels in a sample from the weight of the sample. The approximate number of kernels in a sample is divided into the sample envelope volume to determine the average kernel envelope volume. The change in average kernel weight resulted in a significant change in the calculated average kernel envelope volume. The data in this section shows the new average kernel weight and average kernel envelope volume. Records showing the original values are included in section 14.

The following pages shows the inspection report form (IRF-01). Following IRF-01 are the individual data report forms for the measurements that were performed.

Inspection Report Form IRF-01: BWXT LEUCO Kernel Composite 69302

Procedure: AGR-CHAR-PIP-01 Rev. 1

Property	Measured Data				Specification INL EDF-4380 Rev. 6	Acceptance Criteria	Acceptance Test Value	Data Records
	Mean (x)	Std. Dev. (s)	# measured (n)	k or t value				
Average kernel diameter (μm)	349.7	9	4304	1.645	mean 350 ± 10	A = $x - ts/\sqrt{n} \geq 340$	349.5	DRF-06 DRF-09
				2.38	dispersion $\leq 0.01 < 300$ $\leq 0.01 > 400$	B = $x + ts/\sqrt{n} \leq 360$	349.9	
	1.021		4304		dispersion $\leq 0.10 \geq 1.05$	C = $x - ks > 300$	328.3	DRF-06 DRF-09
						D = $x + ks < 400$	371.1	
Kernel ellipticity (D_{\max}/D_{\min})	1.021		4304			≤ 1 in 50 or ≤ 7 in 142	94	DRF-06 DRF-09
Kernel envelope density (Mg/m^3)	10.924	0.015	5	2.132	mean ≥ 10.4	A = $x - ts/\sqrt{n} \geq 10.4$	10.91	DRF-15 DRF-22

Comments:

94 kernels with ellipticity ≥ 1.05 out of 4304 kernels measured passes the dispersion specification acceptance criteria of ≤ 397 in 4304.
 This composite would pass a control limit of ≥ 1.035 at 10% tolerance limit with 95% confidence level.
 This composite would pass a control limit of ≥ 1.05 at 2.6% tolerance limit with 95% confidence level.

7 Characterization of NUCO kernel composite

This section contains data on the kernel composite used for buffer process qualification batches. The data was obtained according to product inspection plan AGR-CHAR-PIP-01R1. Some of the kernel data in this section was used as input for subsequent measurements of coating properties (e.g., buffer density). This is only a partial analysis of the kernel composite and was not used for product acceptance. Characterization of the kernel composite for acceptance according to the specific requirements listed in section 4 of INL EDF-4380, is documented in the BWXT data package for G73B-NU-69300. The BWXT kernel lot G73B-NU-69300 was riffled into sublots for characterization and coating. The ORNL identification for these kernels was NUCO350-## (where ## were a series of integers beginning with 01).

Note that the average kernel weights were remeasured using a revised procedure which improved the accuracy of the reported value by improving the randomness of the measured samples. The NUCO average kernel weight changed from $(2.39 \pm 0.03) \cdot 10^{-4}$ grams per kernel to $(2.308 \pm 0.009) \cdot 10^{-4}$ grams per kernel. On data report form DRF-15 for the measurement of average kernel envelope density, the average kernel weight is used to approximate the number of kernels in a sample from the weight of the sample. The approximate number of kernels in a sample is divided into the sample envelope volume to determine the average kernel envelope volume. The change in average kernel weight resulted in a significant change in the calculated average kernel envelope volume. The data in this section shows the new average kernel weight and average kernel envelope volume. Records showing the original values are included in section 14.

The following pages shows the inspection report form (IRF-01). Following IRF-01 are the individual data report forms for the measurements that were performed.

Inspection Report Form IRF-01: BWXT NUCO Kernel Composite 69300								
Procedure: AGR-CHAR-PIP-01 Rev. 1								
Property	Measured Data				Specification INL EDF-4380 Rev. 4	Acceptance Criteria	Acceptance Test Value	Data Records
	Mean (x)	Std. Dev. (s)	# measured (n)	k or t value				
Average kernel diameter (μm)	344.9	15	4202	1.645	mean 350 ± 10	$A = x - ts/\sqrt{n} \geq 340$	344.5	DRF-06 DRF-09
				2.38	dispersion $\leq 0.01 < 300$ $\leq 0.01 > 400$	$B = x + ts/\sqrt{n} \leq 360$	345.3	
Kernel ellipticity (D_{\max}/D_{\min})	1.022		4202		dispersion $\leq 0.10 \geq 1.05$	$C = x - ks > 300$ $D = x + ks < 400$	309.2 380.6	DRF-06 DRF-09
Kernel envelope density (Mg/m^3)	10.800	0.006	5	2.132	mean ≥ 10.4	$\leq 1 \text{ in } 50$ or $\leq 7 \text{ in } 142$	186	DRF-15 DRF-22

Comments								
186 kernels with ellipticity ≥ 1.05 out of 4202 kernels measured passes the dispersion specification acceptance criteria of ≤ 387 in 4202.								
This composite would pass an ellipticity control limit of ≥ 1.038 at 10% tolerance limit with 95% confidence level.								
This composite would pass an ellipticity control limit of ≥ 1.05 at 5% tolerance limit with 95% confidence level.

8 Characterization of buffer on interrupted batches

This section contains data on the buffer coating density and other buffer properties for particles removed from the coater after deposition of only the buffer layer. The data was obtained according to product inspection plan AGR-CHAR-PIP-02R4. The buffer on these particles was deposited under similar conditions as the buffer on the particles in composite LEU01-47T and should therefore be representative of the buffer on the particles in that composite. Density measurements were made on these interrupted batches because it was not feasible to measure the buffer density after all coating layers were applied. According to section 5.3 of EDF-4380, Rev. 6, three representative buffer layers from interrupted batches which meet the specification for buffer density are sufficient to qualify the process for buffer density. The qualifying batches used 350 μm natural uranium oxide/uranium carbide kernels (NUCO). The kernels were obtained from BWXT and were identified as composite G73B-NU-69300. The use of NUCO surrogate kernels was not expected to significantly effect the density of the buffer. A confirmatory batch using LEUCO kernels from G73D-20-69302 was coated and characterized to verify this assumption.

Note that the average kernel weights and volumes for both the LEUCO and NUCO kernel composites were remeasured after coated particle composite characterization was underway in order to improve the accuracy of the reported value, as discussed in sections 6 and 7. On data report form DRF-16 for the buffer envelope density, the average kernel weight and volume are used to calculate the buffer density. The change in average kernel weight and volume resulted in a significant change in the calculated buffer densities previously used to determine acceptability of the buffer deposition conditions. The data in this section shows the new average kernel weight, average kernel volume, and buffer densities. Records showing the original values are included in section 14. The new values for buffer density were about 10% higher than the originally reported values, but both were within the range specified in INL EDF-4380, Rev. 6.

The following page shows the inspection report form (IRF-02A). Following IRF-02A are the individual data report forms for the measurements that were performed. Additional data at the end of this section is provided for information only.

Inspection Report Form IRF-02A: Interrupted Coating Batches - Buffer Density

Procedure:	AGR-CHAR-PIP-02 Rev. 4						
Batch 1 ID:	NUCO350-25B						
Batch 1 description:	Buffer-coated BWXT kernel composite 69300						
Batch 2 ID:	NUCO350-36B						
Batch 2 description:	Buffer-coated BWXT kernel composite 69300						
Batch 3 ID:	NUCO350-54B						
Batch 3 description:	Buffer-coated BWXT kernel composite 69300						

Property	Measured Data				Specification INL EDF-4380 Rev. 6	Acceptance Criteria	Acceptance Test Value	Pass or fail	Data Records
	Mean (x)	Std. Dev. (s)	# measured (n)	t value (t)					
Batch 1: Buffer envelope density (Mg/m ³)	1.08	0.04	5	2.132	mean 1.03 ± 0.15	A = x - ts/vn ≥ 0.88 B = x + ts/vn ≤ 1.18	1.04 1.12	pass pass	DRF-16 DRF-22
Batch 2: Buffer envelope density (Mg/m ³)	1.11	0.05	5	2.132	mean 1.03 ± 0.15	A = x - ts/vn ≥ 0.88 B = x + ts/vn ≤ 1.18	1.06 1.16	pass pass	DRF-16 DRF-22
Batch 3: Buffer envelope density (Mg/m ³)	1.11	0.04	5	2.132	mean 1.03 ± 0.15	A = x - ts/vn ≥ 0.88 B = x + ts/vn ≤ 1.18	1.07 1.15	pass pass	DRF-16 DRF-22

Comments

Standard deviations are $\sqrt{5}$ times the uncertainties in buffer density (standard errors) reported on DRF-16.
 Average thickness of buffer was 108 μm based on average envelope volume of 9.25E-5 cc (effective diameter of 561 μm) and average kernel diameter of 345 μm .
 Average thickness of buffer was 108 μm based on average outer diameter of 561 μm obtained per DAM-10 and average kernel diameter of 345 μm .
 Confirmatory batch on LEUCO kernels, LEU01-163: mean buffer density = 1.10 g/cc.

9 Characterization of IPyC on interrupted batches

This section contains data on the inner pyrocarbon (IPyC) coating density and other properties for particles removed from the coater after deposition of only the buffer and IPyC layers. The data was obtained according to product inspection plan AGR-CHAR-PIP-02R4. The IPyC on these particles was deposited under similar conditions as the IPyC on the particles in composite LEU01-47T and should therefore be representative of the IPyC on the particles in that composite. Density measurements were made on these interrupted batches because it was not feasible to measure the IPyC density after all coating layers were applied.

The IPyC coatings for variant 1 were deposited at $\sim 25^{\circ}\text{C}$ higher temperature than the baseline IPyC coatings. The variant 1 IPyC coatings are not required to meet the IPyC density specification in section 5.3 of EDF-4380, Rev. 6. However, the expected mean IPyC density according to section 3.2 of EDF-4380 is $\sim 1.85 \text{ g/cc}$. The observed mean IPyC densities for the three interrupted batches were in good agreement with the expected value.

The following page shows the inspection report form (IRF-02B). Following IRF-02B are the individual data report forms for the measurements that were performed. Additional data at the end of this section is provided for information only.

For Information Only

The information in the remainder of this section reports results of measurements not required by the fuel specification and is provided for information only.

Summary of "info only" measurements

Coating Thickness

		Buffer thickness (μm)	IPyC thickness (μm)
Batch 1	LEU01-38I	110	37.2
Batch 2	LEU01-30I	104	36.5
Batch 3	LEU01-34I	111	37.5
Average		108	37.1

Open Porosity between 250 psi and 10000 psi

		Average particle weight (g)	Open porosity (ml/m^2)
Batch 1	LEU01-38I	4.16E-04	1.88
Batch 2	LEU01-30I	4.09E-04	1.53
Batch 3	LEU01-34I	4.19E-04	1.86
Average		4.15E-04	1.76

Note: The open porosity measurement on the IPyC was calculated from the mercury intrusion between 250 psi and 10000 psi per table 5.3 in EDF-4380, Rev. 6. In the upper half of this pressure range, there is some compression of the buffer layer that results in a value for open porosity that is higher than the actual value. The open porosity of the IPyC, calculated from the mercury intrusion between 250 psi and 5000 psi, is shown in the table below. Studies have shown that the open porosity measurement for this pressure range is less affected by buffer compression and more appropriate for measurements on IPyC.

Open Porosity between 250 psi and 5000 psi

		Average particle weight (g)	Open porosity (ml/m^2)
Batch 1	LEU01-38I	4.16E-04	1.47
Batch 2	LEU01-30I	4.09E-04	1.15
Batch 3	LEU01-34I	4.19E-04	1.44
Average		4.15E-04	1.35

10 Characterization of first batch of TRISO-coated particles

This section contains data on LEU01-43T, the first batch of TRISO-coated particles used for the LEU01-47T particle composite. The data was obtained according to product inspection plan AGR-CHAR-PIP-03R2.

Note that some of the carbon deposited for the buffer layer reacted with the kernel to form a uranium carbide layer between the kernel and the buffer. The uranium carbide layer was not included in the measurement of the buffer thickness. The thickness of this carbide layer varied, but was typically around $6 \mu\text{m}$ thick and effectively increased the kernel radius by that amount.

The following pages show the inspection report form (IRF-03). Following IRF-03 are the individual data report forms for the measurements that were performed. Additional data at the end of this section is provided for information only. This batch was determined to satisfy the specifications in section 5.2 of EDF 4380, Rev. 6.

Inspection Report Form IRF-03: Coated Particle Batches									
Procedure:		AGR-CHAR-PIP-03 Rev. 2

12 Characterization of third batch of TRISO-coated particles

This section contains data on LEU01-29T, the third batch of TRISO-coated particles used for the LEU01-47T particle composite. The data was obtained according to product inspection plan AGR-CHAR-PIP-03R2.

Note that some of the carbon deposited for the buffer layer reacted with the kernel to form a uranium carbide layer between the kernel and the buffer. The uranium carbide layer was not included in the measurement of the buffer thickness. The thickness of this carbide layer varied, but was typically around $6 \mu\text{m}$ thick and effectively increased the kernel radius by that amount.

The following pages show the inspection report form (IRF-03). Following IRF-03 are the individual data report forms for the measurements that were performed. Additional data at the end of this section is provided for information only. This batch was determined to satisfy the specifications in section 5.2 of EDF 4380, Rev. 6.

Inspection Report Form IRF-03: Coated Particle Batches

Procedure:	AGR-CHAR-PIP-03 Rev. 2						
Coated particle batch ID:	LEU01-29T						
Coated particle batch description:	Variant 1: TRISO on BWXT kernel composite 69302						

Property	Measured Data				Specification INL EDF-4380 Rev. 6	Acceptance Criteria	Acceptance Test Value	Pass or fail	Data Records
	Mean (x)	Std. Dev. (s)	# measured (n)	t value (t)					
Average buffer thickness for each particle (μm)	103.1	7.3	209	1.652	mean 100 ± 15	$A = x - ts/\sqrt{n} \geq 85$	102.3	pass	DRF-08
						$B = x + ts/\sqrt{n} \leq 115$	103.9	pass	DRF-11
Average IPyC thickness for each particle (μm)	40.4	2.4	229	1.652	mean 40 ± 5	$A = x - ts/\sqrt{n} \geq 35$	40.1	pass	DRF-08
						$B = x + ts/\sqrt{n} \leq 45$	40.7	pass	DRF-11
Average SiC thickness for each particle (μm)	36.6	0.9	230	1.652	mean 35 ± 4	$A = x - ts/\sqrt{n} \geq 31$	36.5	pass	DRF-08
						$B = x + ts/\sqrt{n} \leq 39$	36.7	pass	DRF-11
Average OPyC thickness for each particle (μm)	41.1	2.0	230	1.652	mean 40 ± 5	$A = x - ts/\sqrt{n} \geq 35$	40.9	pass	DRF-08
						$B = x + ts/\sqrt{n} \leq 45$	41.3	pass	DRF-11
Particles with missing OPyC			15565		defect fraction $\leq 6.0 \times 10^{-4}$	≤ 4 in 15,500	0	pass	DRF-19

Comments

Goldspot analysis performed on missing OPyC sample for information only. 15 out of 15565 gold spots observed.

13 Characterization of TRISO-coated particle composite

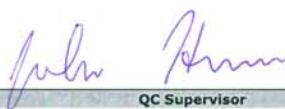

This section contains data on the TRISO-coated particle composite, LEU01-47T. The data was obtained according to product inspection plan AGR-CHAR-PIP-04R2.

Note that some of the carbon deposited for the buffer layer reacted with the kernel to form a uranium carbide layer between the kernel and the buffer. The uranium carbide layer was not included in the measurement of the buffer thickness. The thickness of this carbide layer varied, but was typically around 6 μm thick and effectively increased the kernel radius by that amount.

The following pages shows the inspection report forms (IRF-04A and IRF-04B) for the LEU01-47T composite. Following IRF-04A and IRF-04B are the individual data report forms for the measurements that were performed. Additional data at the end of this section is provided for information only. This composite was determined to satisfy the specifications in section 5.3 of EDF 4380, Rev. 6.

Inspection Report Form IRF-04A: Coated Particle Composites

Procedure:	AGR-CHAR-PIP-04 Rev. 2									
Coated particle composite ID:	LEU01-47T									
Coated particle composite description:	Variant 1: TRISO on BWXT kernel composite 69302									
Property	Measured Data				Specification	Acceptance Criteria	Acceptance Test Value	Pass or fail		
	Mean (x)	Std. Dev. (s)	# measured (n)	k or t value	INL EDF-4380 Rev. 6			Data Records		
Average buffer thickness for each particle (μm)	102.5	7.1	177	1.654	mean 100 ± 15	A = $x - ts/\sqrt{n} \geq 85$	101.6	pass		
				2.584	dispersion $\leq 0.01 \leq 55$	B = $x + ts/\sqrt{n} \leq 115$	103.4	pass		
Average IPyC thickness for each particle (μm)	40.5	2.4	232	1.651	mean 40 ± 4	A = $x - ts/\sqrt{n} \geq 36$	40.2	pass		
				2.549	dispersion $\leq 0.01 \leq 30$ $\leq 0.01 \geq 56$	B = $x + ts/\sqrt{n} \leq 44$	40.8	pass		
Average SiC thickness for each particle (μm)	35.7	1.2	233	1.651	mean 35 ± 3	C = $x - ks > 30$	34.4	pass		
				2.549	dispersion $\leq 0.01 \leq 25$	D = $x + ks < 56$	46.6	pass		
Average OPyC thickness for each particle (μm)	41.1	2.4	233	1.651	mean 40 ± 4	A = $x - ts/\sqrt{n} \geq 36$	40.8	pass		
				2.549	dispersion $\leq 0.01 \leq 20$	B = $x + ts/\sqrt{n} \leq 44$	41.4	pass		
Buffer envelope density	See IRF-02A							pass		
IPyC sink/float density	See IRF-02B							Note 1		
SiC sink/float density (Mg/m^3)	3.2060	0.0021	42	1.683	mean ≥ 3.19	A = $x - ts/\sqrt{n} \geq 3.19$	3.205	pass		
				2.913	dispersion $\leq 0.01 \leq 3.17$	C = $x - ks > 3.17$	3.200	pass		
OPyC sink/float density	See IRF-04B							pass		
IPyC anisotropy (BAFo equivalent)	1.0140	0.0014	10	1.833	mean ≤ 1.035	B = $x + ts/\sqrt{n} \leq 1.035$	1.015	pass		
				3.981	dispersion $\leq 0.01 \geq 1.06$	D = $x + ks < 1.06$	1.020	pass		
OPyC anisotropy (BAFo equivalent)	1.0132	0.0017	10	1.833	mean ≤ 1.035	B = $x + ts/\sqrt{n} \leq 1.035$	1.014	pass		
				3.981	dispersion $\leq 0.01 \geq 1.06$	D = $x + ks < 1.06$	1.020	pass		
Particles with SiC gold spot defects			22461		defect fraction $\leq 1.0 \times 10^{-3}$	≤ 6 in 12,000 or ≤ 14 in 22,000	11	pass		
Particle aspect ratio			1808		dispersion $\leq 0.01 \geq 1.14$	≤ 1 in 500 or ≤ 7 in 1420	0	pass		
Particles with SiC burn-leach defects			121117		defect fraction $\leq 1.0 \times 10^{-4}$	≤ 1 in 50,000 or ≤ 6 in 120,000	1	pass		
Particles with missing OPyC			31191		defect fraction $\leq 3.0 \times 10^{-4}$	≤ 4 in 31,000	0	pass		
SiC microstructure			3		comparison to visual standard	all imaged pass visual standard comparison	3	pass		
Comments										
Note 1: Variant 1 is designed to have a density around 1.85 g/cc and is not required to meet the IPyC density specification.

grain structure acceptable	Yes	Yes	Yes

Comments

Some large columnar grains were observed. The largest extended through half the layer thickness.

14 Superceded data

This section contains data related to the LEU01-47T TRISO-coated particle composite that has been superceded by more recent analysis.

It was determined that the average kernel weight as measured using procedure AGR-CHAR-DAM-22 Rev. 0 was of insufficient accuracy. The average kernel weight was remeasured to improve the accuracy of the reported value according to AGR-CHAR-DAM-22 Rev. 1. The measured value of the LEUCO average kernel weight changed from $(2.47 \pm 0.01) \cdot 10^{-4}$ grams per kernel to $(2.418 \pm 0.006) \cdot 10^{-4}$ grams per kernel. The measured value of the NUO average kernel weight changed from $(2.39 \pm 0.03) \cdot 10^{-4}$ grams per kernel to $(2.308 \pm 0.009) \cdot 10^{-4}$ grams per kernel. On data report form DRF-15 for the measurement of average kernel envelope density, the average kernel weight is used to approximate the number of kernels in a sample from the weight of the sample. The approximate number of kernels in a sample is divided into the sample envelope volume to determine the average kernel envelope volume. The change in average kernel weight resulted in a significant change in the calculated average kernel envelope volume. On data report form DRF-16 for the buffer envelope density, the average kernel weight and volume are used to calculate the buffer density. The change in average kernel weight and volume resulted in a significant change in the calculated buffer densities previously used to determine acceptability of the buffer deposition conditions. The data in this compilation shows the new average kernel weights and average kernel volumes in sections 6 and 7, and the new buffer densities in section 8. Records showing the original values are included in this section. The new values for buffer density were about 10% higher than the originally reported values, but both were within the range specified in INL EDF-4380, Rev. 6.

Comments

Standard deviations are $\sqrt{5}$ times the uncertainties in buffer density (standard errors) reported on DRF-16.
 Average thickness of buffer was 108 μm based on average envelope volume of 9.25E-5 cc (effective diameter of 561 μm) and average kernel diameter of 345 μm .
 Average thickness of buffer was 108 μm based on average outer diameter of 561 μm , obtained per DAM-10 and average kernel diameter of 345 μm .

Data Report Form DRF-16: Measurement of Buffer Envelope Density using a Mercury Porosimeter

Procedure:	AGR-CHAR-DAM-16 Rev. 2
Operator:	S. D.NUNN
Buffer-coated kernel batch ID:	NUCO350-58B
Batch Description:	Composite of Buffer Coated BWXT Kernel Composite 69300
Thermocouple Expiration Date:	5/23/06
Penetrometer Expiration Date:	5/25/06
Completed DRF Filename:	\mc-agr\AGR\Porosimeter\S05062206\S05062206_DRF16R2.xls

Mean average weight/buffer-coated kernel (g):	3.09E-04
Uncertainty in mean average weight/b-c kernel (g):	4.99E-07
Mean average weight/bare kernel (g):	2.39E-04
Uncertainty in mean average weight/bare kernel (g):	2.52E-06
Mean average envelope volume/bare kernel (cc):	2.21E-05
