ABSTRACT

In 2012, nondestructive assay experts from Oak Ridge National Laboratory (ORNL) and the Argentine Nuclear Regulatory Authority (ARN) completed a series of comparative enrichment measurements in support of the safeguards cooperation agreement between the US Department of Energy and the ARN. The measurements were performed on SRM-969 uranium standards in October and November 2012 by ORNL and ARN staff at their respective facilities to verify the nondestructive assay measurement expertise and capabilities of nuclear safeguards staff and technicians. A total of sixty measurements using a combination of 7 detector/software systems were performed on these low-enriched uranium standards. The measurement specifics and results are presented in this report. In most cases, the measurement results agreed within the measurement uncertainty of each institution and the declared enrichments of the standards; thus they confirm the technical capability of the ORNL and ARN staff.

1. INTRODUCTION

In 1994, the US Department of Energy (DOE) and the Argentine Nuclear Regulatory Authority (ARN) signed a safeguards cooperation agreement that provides for research and development in nuclear material control, accountancy, verification, physical protection and advanced containment and surveillance technologies for international safeguards applications. The scope of work for specific projects and activities are defined in documents named action sheets. Action sheet 16: “Nondestructive Assay Technician Training and Technical Support” was signed in 2006 to provide for cooperation in enhancing and maintaining the competency and training capabilities of ARN’s technicians and safeguards staff in nondestructive assay (NDA) measurement methods, techniques, and systems.

In pursuant to the scope of work defined in Action Sheet 16, NDA experts from Oak Ridge National Laboratory (ORNL) provided technical support in developing instructional materials, and in the execution of an enrichment training program and laboratory exercises. Upon completion of Action Sheet 16, ARN will use the instructional materials to meet future safeguards training and measurement requirements. To assess the capability of ARN technicians and safeguards staff in performing these NDA enrichment measurements, ARN and ORNL performed a series of independent measurements of SRM-969 uranium standards (ARN received these standards under action sheet 15). This report outlines the results of the measurement campaign.

2. MEASUREMENT DESCRIPTION

Each laboratory completed independent measurements of all National Bureau of Standards SRM-969 standards using various hardware and software combinations. The SRM-969 standard specifications are listed in Table 1.

The measurement systems (hardware/software combinations) used for comparison are listed in Table 2. Discrepancies in the hardware used or software versions used for analysis of the standards are specified in footnotes to the table. For each measurement, when applicable, the enrichment, uncertainty, and spectrum were recorded. Although longer measurements may be performed in practice, 5 minute measurements were performed during this measurement campaign.

Table 3 provides pictures of the hardware used by ORNL and ARN for the measurements described in Table 2. Additional information related to the detector/MCA (multichannel analyzer) settings for each measurement scenario is provided in Appendix A.

With the exception of the cadmium-zinc-telluride (CZT) detector, similar equipment was used by both organizations. With respect to the CZT detectors, ORNL used the spectrometric detector probe (SDP 310/Z/LC/60S) and ARN used the Ritec 500. The SDP detector used by ORNL has a sensitive volume of between 50 and 60 mm³, whereas the Ritec model used by ARN has a sensitive volume of approximately 500 mm³. The difference in CZT crystal size (and collimators), and therefore efficiency, is reflected in the results and uncertainties for these measurement scenarios. These results are discussed in more detail in Section 3.

Table 1. SRM-969 standards

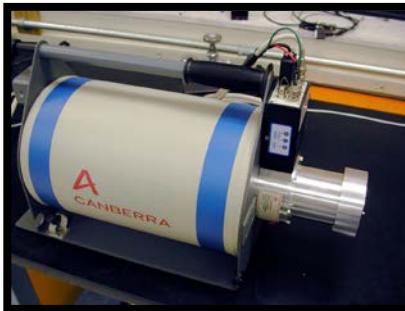

Source ID	Declared Enrichment (wt%)	Uncertainty

NBS-071-078	0.7119	0.005
NBS-194-078	1.942	0.001
NBS-295-078	2.949	0.002
NBS-446-078	4.4623	0.0032

Table 2. Measurement systems (hardware/software) used for enrichment measurements

Software	Version	Detector	MCA	Function
WinU235	1.00.0011 ¹	NaI	GBS MCA-166	Spectrum acquisition and enrichment measurement
NaIGEM	1.52b			Spectrum acquisition and enrichment measurement
WinU235	1.00.0011 ¹	CZT-500 ²		Spectrum acquisition and enrichment measurement
NaIGEM	1.52b			Spectrum acquisition and enrichment measurement
WinUF6	1.01.0000	HPGe		Spectrum acquisition and enrichment measurement
WinSpec	2.02.0002 ³			Spectrum acquisition
MGAU	3.21 ⁴			Spectrum acquisition and enrichment measurement
NaIGEM for HM-5			HM-5	Spectrum acquisition and enrichment measurement

¹ARN used WinU235 v 1.01.0000.
²ORNL used a spectrometric detection probe model 310/Z/LC/60S CZT detector instead of the models listed above.
³ARN used WinSpec v 2.02.0004.
⁴ARN used MGAU v 4.0.

Table 3. Hardware used for enrichment measurements

ORNL hardware	ARN hardware
	
GBS Elektronik GmbH MCA-166 (MMCA)	
	
1 x 2 in. EFC NaI detector paired with the MMCA	
	
Canberra GL0515R HPGe detector paired with the MMCA	
	
SDP 310/Z/LC/60S CZT detector paired with the MMCA and used with W collimator	Ritec CZT 500 paired with the MMCA and used with Pb collimator
	
Thermo (now FLIR) HM-5 with W collimator	

3. RESULTS

The results of the round-robin enrichment measurement campaign are given in Table 4. The hardware/software packages are identified, as well as the declared enrichments of the SRM-969 standards. The term “cal” in the results table indicates that the standard was used to calibrate the system. The measurement uncertainties are also reported in the table.

The results show very good agreement between the ORNL and ARN measurements and with the declared values of the SRM-969 standards. The largest difference between ORNL and ARN results occurred when the CZT detectors were used. The ORNL measurements had a larger uncertainty because of the low efficiency of the small CZT detector used. The plots summarizing the data are shown in Figs. 1–6. The measured enrichments and errors are shown on the plots.

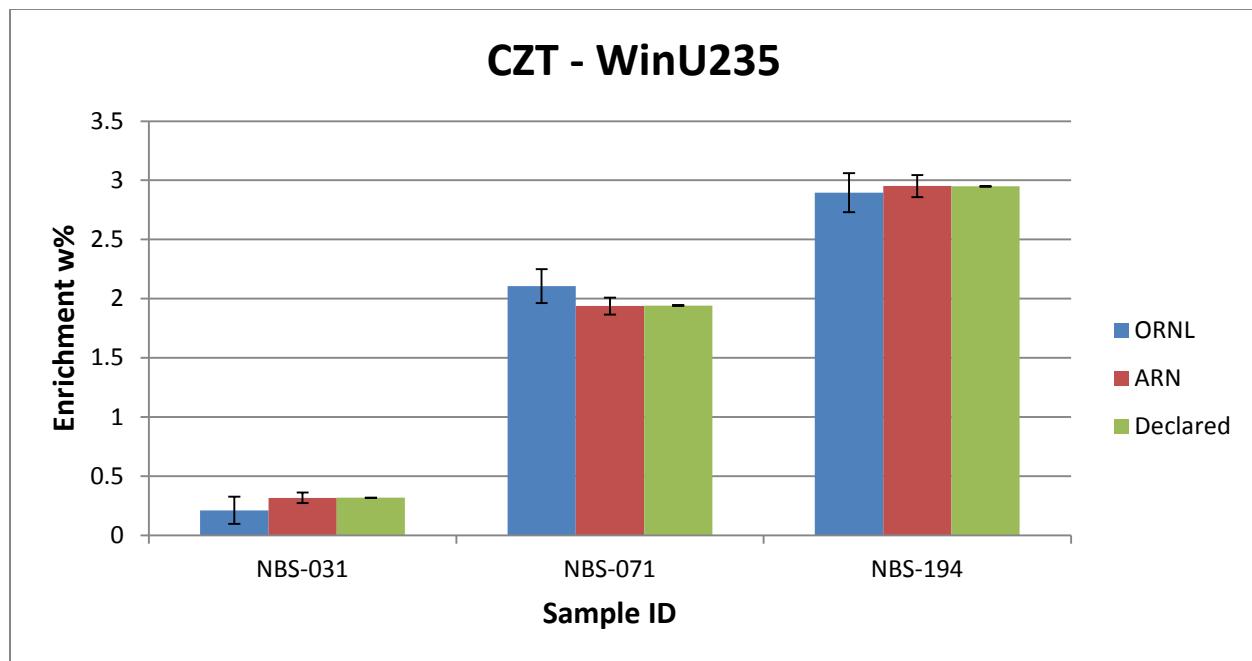

Fig. 1. Enrichment results using a CZT detector and WinU235 software.

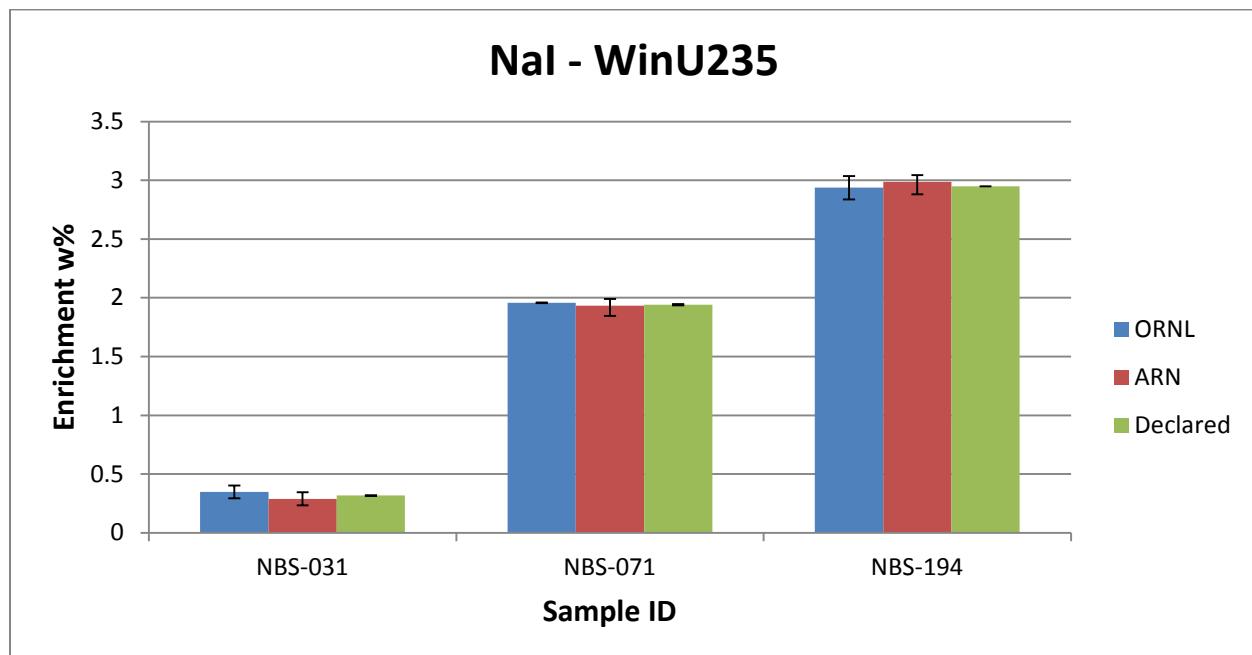

Fig. 2. Enrichment results using a NaI detector and WinU235 software.

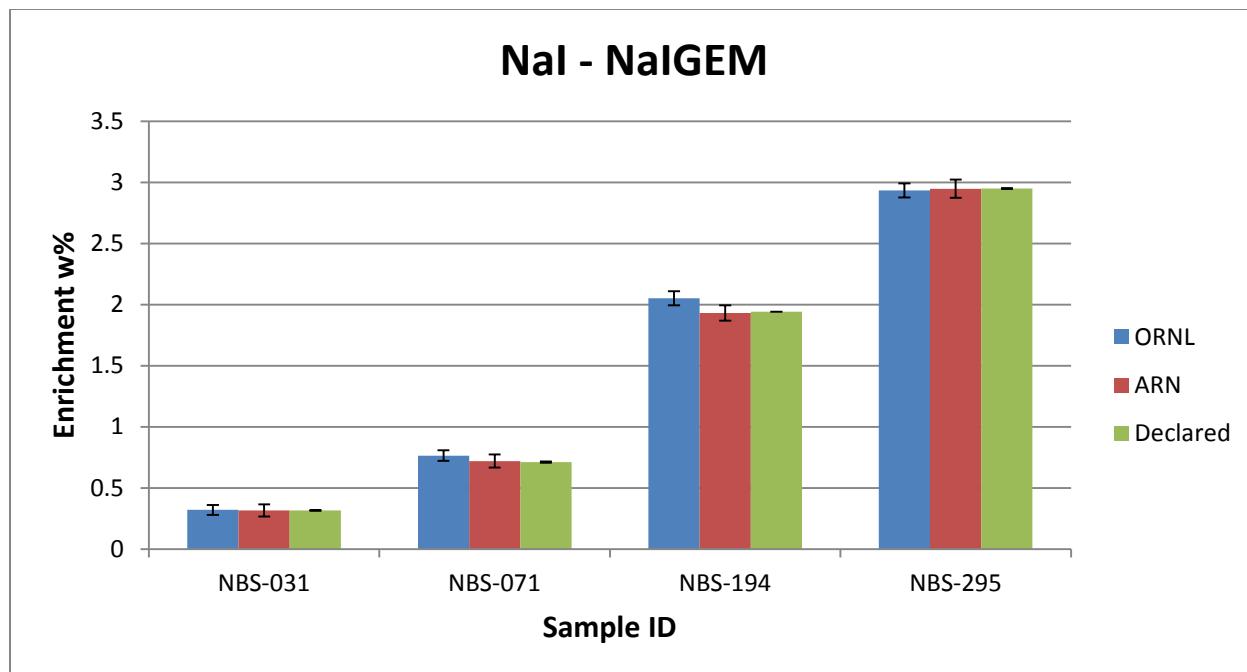

Fig. 3. Enrichment results using a NaI detector and NaIGEM software.

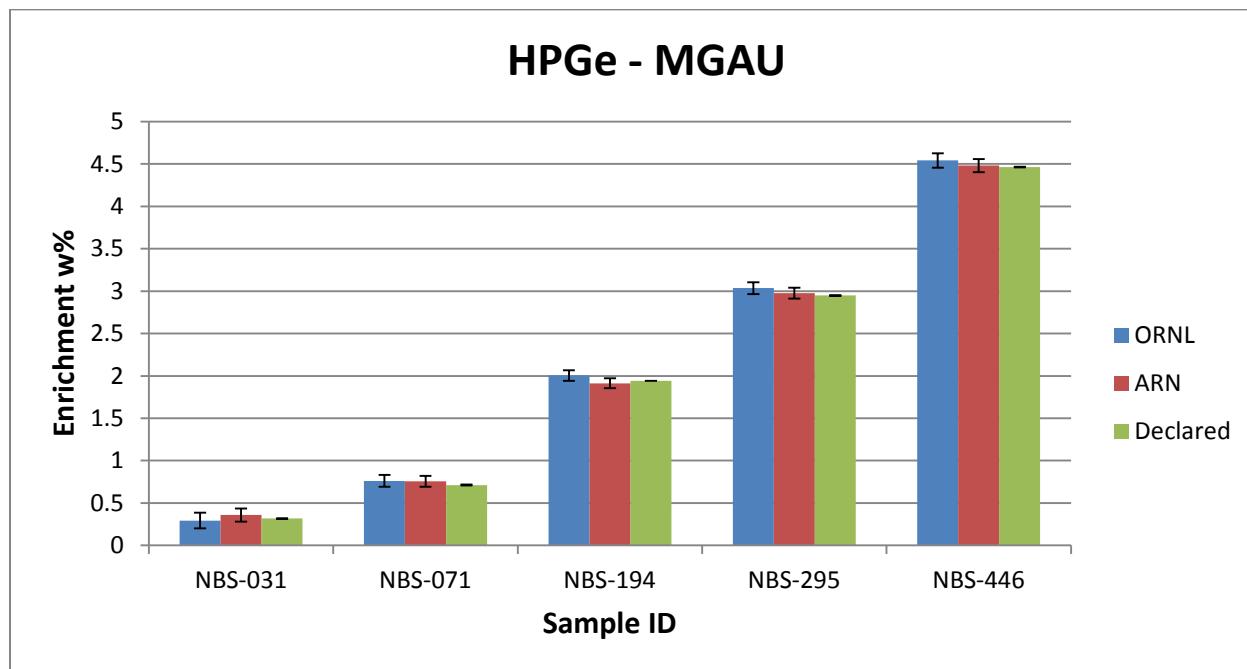

Fig. 4. Enrichment results using an HPGe detector and MGAU software.

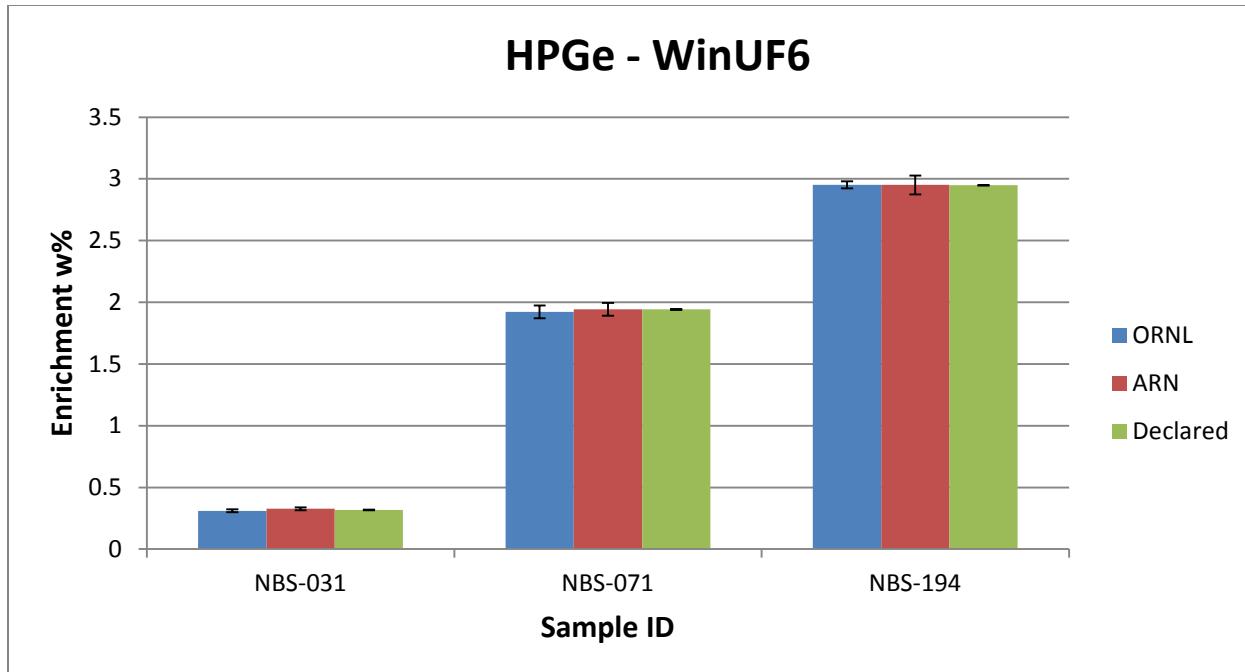

Fig. 5. Enrichment results using an HPGe detector and WinUF6 software.

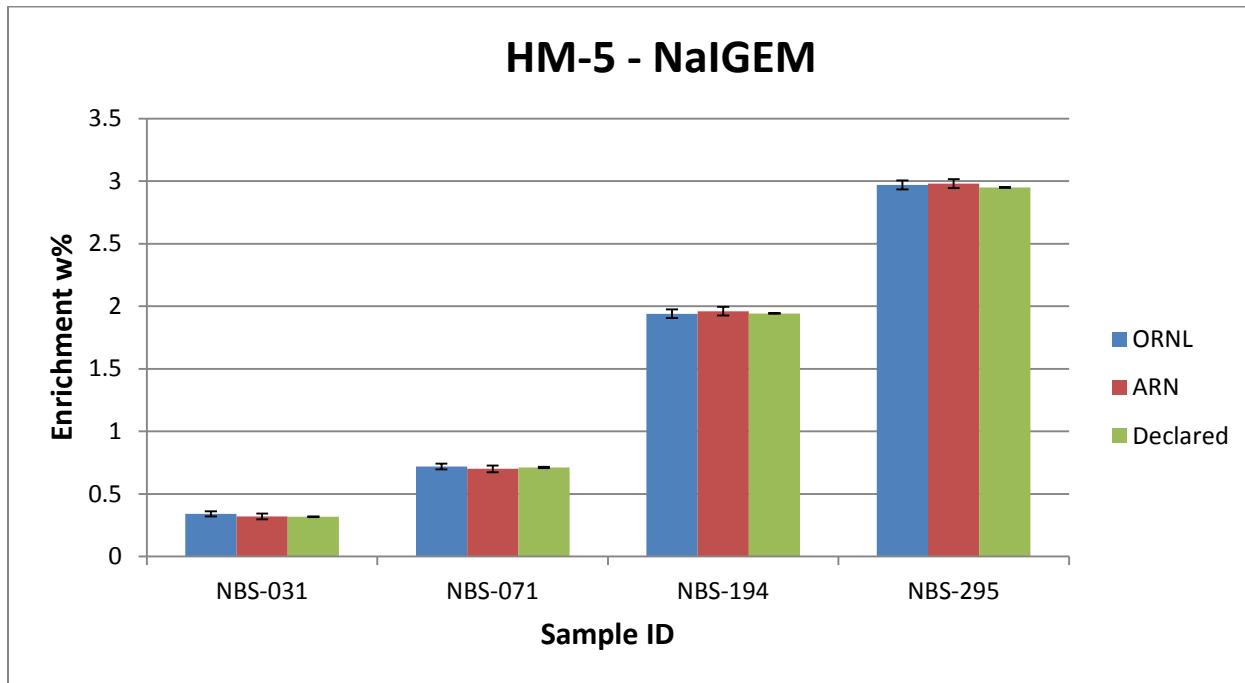

Fig. 6. Enrichment results using an HM-5 running NaIGEM software.

A number of spectra were collected during the measurement campaign. These spectra collected at ORNL and ARN were reviewed and are in reasonable agreement. The spectra are labeled and attached in Appendix B.

4. CONCLUSION

ORNL and ARN conducted a total of 60 measurements using 7 detector/software combinations. The measurements were performed using 5 NIST-traceable standards with enrichments ranging from 0.31% to 4.46% ^{235}U . The data show very good agreement between the measurements performed by ORNL staff and those performed by ARN staff. This agreement provides confidence that the ORNL and ARN safeguards staffs are well trained and capable of performing similar enrichment measurements with these instruments and software packages.
